Preface

Thank you for buying MT5000 and MT4000 series industrial embedded Human-Machine Interface (hereinafter referred to as "HMI") products.

HMI is a two-way communication bridge between an operator and a machine. A user can combine characters, buttons, figures and numerals to process or monitor, manage and deal with the multifunctional display screen which may display ever-changing information anytime. With the rapid development of the mechanical equipment, old operation interfaces can only be operated by skilled service-trained professionals, and furthermore, the operation is difficult and the working efficiency can not be improved. However, the application of the HMI can make clear indication and inform the operator of the current conditions of the machine so that the operation will be simple and visual, misoperations can be reduced, and even a new operator can operate the entire machine easily. Furthermore, the use of the HMI can also implement standard and simple cabling of a machine, and meanwhile the number of I/O points necessary for the PLC (Programmable Logic Controller) can be reduced, and the added value of the entire set of equipment can be relatively improved due to the compact size and high performance of the control panel at the same time when the production cost is reduced.

As a new kind of HMI, touch screen has attracted wide attention since its emergence. With its simplicity, operational convenience, powerful function and excellent stability, it is applicable to industrial environments, and even can find wide application in our daily life. For example, automatic parking equipment, automatic car washer, roller-bridge lifting and hoisting control, production line monitoring & control, or even intelligent building management, conference room audible/visual control, and temperature adjustment.

With the rapid development of the science and technology, more and more machines and field operations need the use of HMIs. The powerful function of PLC and the complicated data processing also call for the emergence of a convenient matching HMI. The development of touch screen is undoubtedly a great innovation in the automation field in the 21st century.

MT5000 and MT4000 are a brand-new generation of industrial embedded touch screen HMIs, with the following features:

- Embedded RISC CPU featuring high speed and low power consumption
- Embedded operating system
- Higher speed and more smooth operation
- Richer color and finer display
- The MT5000 fully supports such high-speed interfaces as the Ethernet and USB interfaces, and the MT4000 supports high-speed USB interfaces.
- More resources, and lower price

- Simple, easy to use, stable and reliable.

The MT5000 and MT4000 series HMIs have the following new features:

- The 65536-color display mode gives richer color to the touch screen, with incomparable display effect.
- With the application of powerful 200 ~ 400 MHz 32-bit RISC processor, the MT5000 and MT4000 have higher processing speed.
- The product supports simultaneous communications of multiple serial ports. The two serial ports of the standard hardware can use different protocols to connect different controllers at the same time.
- The MT5000 completely supports the Ethernet communications function, and multiple touch screens can be networked at will.
- The function of image file support is added, supporting the import of images in such formats as 24-bit bitmap, JPEG and GIF.
- Standard C-language macrocodes can be triggered in multiple modes, featuring powerful function, high flexibility and easy operation.
- Powerful timer function
- USB download greatly accelerates the download speed in user configuration.
- The communication capability of the USB ports is increased, so that programs can be downloaded through the USB ports.
- SPC (Stored Programmable Controlled) contrast and brightness: The contrast and brightness are adjusted through the Local Bit (LB).
- User-defined start interface: The user can customize a start LOGO interface.
- Supporting all fonts of the Windows platform;
- Supporting the drawing of any arcs and sector diagrams;
- Supporting direct connection with most mainstream PLCs, the MT5000 and MT4000 will have wider market and application prospect.
- With the simple, convenient and powerful EV5000 configuration software, the user can master its design method and design first-class works at the fastest speed.

Before using the MT5000 and MT4000 series touch screens, please read this manual carefully to ensure correct operation of the equipment and the safety of the user and equipment so that the touch screens can achieve the best operation effect. In the meantime, please keep the manual well for future references in commissioning, maintenance, examination and repair. If you have any doubts or problems during the use of the product, please feel free to contact the Technical Support Department of our company without delay.

Our product will surely better meet your requirements, and the application of our product will boost your business career. Any suggestions and comments on our products are welcome. If you have any suggestions, comments or complaints on our product, please contact us immediately at any time (we provide 7 days * 24 hours service), and we will make quick and satisfactory response as soon as possible.

The following sections present a detailed description of our product.

Chapter 1 Installation of EV5000

1.1 Installing EV5000

• Minimum Computer Hardware Requirement (Recommended Configuration):

CPU: INTEL Pentium II or better

Memory: 128 MB or higher (512 MB is recommended)

Hard disk: 2.5 GB or above, at least a free disk space over 100 MB (40G or above is recommended)

CD ROM: One 4X CD-ROM optical drive

Monitor: Supporting monitor with a resolution of 800*600, and 16-bit color or above (recommended: 1024×768, 32-bit true color or above)

Mouse and keypad: One for each

RS-232 COM port: At least one port available for serial communications between PC and the touch panel

USB port: USB A-type port (1.1 or 2.0)

• Operating system:

Windows 2000 (with SP4)/ Windows XP (with SP2)

• Installation procedure:

1 After Inserting the EV5000 setup disk into the optical drive, the setup program will automatically run, or you may manually run the **Setup.exe** file under the root directory of the CD.

The following interface appears:

EV5000_UNICODE_ENU - InstallShield Wizard	
Preparing Setup Please wait while the InstallShield Wizard prepares the setup.	PA -
EV5000_UNICODE_ENU Setup is preparing the InstallShield Wizard, which will guid through the rest of the setup process. Please wait.	e you
InstallShield	Cancel
	Cancel

2 2 Follow the instructions of the InstallShield Wizard, click the *Next* button, enter the user's information, as shown in the following figure:

3 Click **Finish** to complete the installation.

4 To run the program, find the executable program under the directory of Start \rightarrow Programs \rightarrow Stepservo \rightarrow ev5000.

1.2 Interface Diagram

The COM0/COM1 ports in MT5000 and MT4000 can be connected to a PC or a PLC. The MT5000 and MT4000 have very powerful communication capability. The MT5000 provides one Ethernet interface (the MT4000 does not have any Ethernet interface), one USB interface, one print interface, and two serial ports). Therefore, the MT5000 and MT4000 are capable of communications with most devices with communication capabilities. Thus, it can be seen that the MT5000 and MT4000 have wide applications. These interfaces will be described one by one in the following sections:

1.2.1 Serial Ports

Presently the MT5000/4000 has two serial ports, marked COM0 and COM1.

The two ports are respectively male and female connectors for the convenience of differentiation. The difference between their pins lies in PIN 7 and PIN 8.

COM0 is a 9-pin male connector, with the pinout definition as follows:

COM0 MALE

PC232/PLC232-NO HARDWARE CONTROL/485/422

COM1 is a 9-pin female connector, with the pinout as follows. Its difference from COM0 is that its PC_RXD and PC_TXD are replaced with TRS_PLC and CTS_PLC hardware control connected to PLC 232.

PLC232-HARDWARE CONTROL/485/422

1.2.2 Ethernet Interface

The MT5000 (MT4000 does not have any Ethernet interface) has an adaptive 10M/100M network interface which can implement such functions as program download, online simulation and interconnection of multiple devices.

With the use of the Ethernet, we can conduct the following operations:

- (1) Downloading programs from a PC to the HMI: The download is much faster than download through an RS232 or USB port;
- (2) Implementing networking and interconnection of multiple HMIs;
- (3) Implementing communications between the HMI and field equipment.

The settings of the Ethernet interface are as follows:

(1) In the **Project Window**, double click the HMI icon, and the following dialog box appears:

HMI Attribute		
Print Setting HMI	Serial Port 0 Setting Task Bar	Serial Port 1 Setting HMI Extend Attribute
	168 0 253 Port Number 255 255 0 GateWay	er 2008
Display Setting Screen Display Mode	Horizontal O Vertical	
Description		
		OK Cancel

(2) Set the IP Address and Port Number. Note that the IP addresses over the same network

should not be the same.

(3) After saving the compilation, download the IP address of the HMI through the serial port or USB port. After download, the IP address on the screen will change to the IP address set in the above figure.

Compile & Download (Option		
нмі Нміо Нмі1	Compile	p (Size > 1024	Byte)
	Download Download Device Serial No.	USB 🔻 COM1 👻	
	IP Address Port	192 168 0 21845	253
	Screen Grid Space X: 20		•
		ОК	Cancel

(4) If the Ethernet interface is used to download the program, the IP address should be set to be different from that of the PC. To modify the IP address, you may turn the two DIP switches in the rear of the touch screen to "**ON**", and then reset the HMI to enter the built-in SETUP window.

(5) Click **Options** in the **Tools** menu, open the compilation download option, select **Ethernet** for the **Download Device**, and set the **IP Address** and **Port** of the touch screen.

Compile & Download	d Option			X
нмі Нміо Нміі	Compile	ap (Size>	1024	Byte)
	Download Download Device Serial No. IP Address Port	COM1 -		253
	Screen Grid Space X: 20	× v	Y: 20	×,
		OK		Cancel

Note: After project download, the IP address of the screen will automatically change to the IP address set in the **HMI Properties** window. If the IP address set in the **HMI Properties** interface is inconsistent with that set in the **Compilation Download Options** window, download by use of the old IP address will fail. In this case, it is necessary to adjust the IP address in **Compilation Download Options** window, or enter the SETUP state to modify the current IP address of the touch screen.

1.2.3 Printer Interface

The MT5000 series and the MT4400T/MT4500T series provide a printer interface. The interface setting is the same as a PC interface. The MT4300 series provides a 15-pin print interface.

Parallel Print Port (15-pin D-SUB Female Connector)

The user can print window, events, texts and bitmaps online.

(1) Printer setting

In the **Project Structure Window**, double click the HMI icon, and the **HMI Attribute** dialog box appears. Enter the **Printer Settings** window, as shown in the following figure:

HMI Attribut	te					×
HM Print 9 Printer	Setting	Ser	ask Bar ial Port 0 Setting ▼	- L	Extend Attribute erial Port 1 Setting	
 Print Tin Print Ext Print Da Print Ext 	ne tend Time(d:h:	v-mm-dd)				
					OK Cance	»

For printing methods, please refer to Chapter 10 which details the print settings and printing methods.

1.2.4 USB Interface

Our MT5000 and MT4000 provide you with a high-speed download channel, that is, the USB interface. The USB interface will greatly increase the download speed, without the need of knowing the IP address of the target touch screen in advance. Therefore, you are recommended to use the USB interface for downloading. For download operations, please refer to Section 3.9.

Chapter 2 Creating a Simple Project

"Ease of use" is one of the most outstanding advantage of our EV5000 configuration software. In this chapter, a step-by-step instruction of creating a simple project containing only one switch control part is given, which makes the user getting started with the basic procedure of project making. More sophisticated projects can be created with similar methods.

2.1 New an empty Project

▶ Part 1:New an empty project.

 After installing the EV5000 software, find the corresponding executable program under the directory "Start → Programs → eview → EV5000", and click the EV5000 icon.

2. The following window appears:

Choose New Project in the File menu, the following dialog box appears. Name the project you want to create. You may also click [>>] to select a path for storing the new project files. In this example, the project name is "test_01". Click Create.

New Project	
Project Name test_01	
Content C:\Program Files\eV5000_UNICODE_ENU\test_(01 >>
OK Cancel	
Ţ	
Browse for Folder	<
Select Folder	
Desktop My Documents My Computer My Computer Stared Documents Shared Documents My Network Places My Network Places	
OK Cancel	

4. Select the proper communication connection mode for the project. The MT5000 touch penel supports serial port and Ethernet connection, while the MT4000 series supports only the serial port now (further revision will support Ethernet also). Click **Connection** in the Component Library window, there are two icons represent serial port and Ethernet mode, respectively. Click the icon of the proper communication mode to select, hold and drag it to the **Project Structure Window**. A wire appears in the Project Structure Window.

Graph element window	\times										•		
Connector			•	·	•	•	·	÷	·	·		•	•
😏 <i>3</i>			Ì.,									r.	•
Serial Port Ethernet		ŀ	•	•	÷	•	•	·	•	•	•	•	•

5. In the HMI window, click to select the model of touch panel corresponding to the actual hardware, hold and drag the icon to the **Project Structure Window**. Release the mouse, and the following dialog box appears:

Display Mode			
HMI Display Mode	horizont	•	OK

Select **Horizontal** or **Vertical** display mode to view the touch panel in horizontal or vertical direction, click **[OK]**.

 Select the proper PLC to be connected, the PLCs supported by EV5000 are listed in the PLC window, click to select, hold and drag it to the **Project Structure Window**, as shown in the following figure:

7. In the Project Structure Window, drag to place the HMI and PLC, when the ports(shown as the gray trapezoids) of the HMI or PLC are close to the end of the wire, the wire will automatically attached to the ports, when both ends are attached to one port of a device, the connection is established.

Note: The connection port number should be consistent with the actual physical connection.

8. Click the HMI0 icon, the following dialog box appears:

HMI Attribute		
Print Setting HMI	Serial Port 0 Setting Task Bar	Serial Port 1 Setting HMI Extend Attribute
Network Setting		
	168 . 0 . 253 Port Number	2008
Subnet Mask 255 .	255 . 255 . 0 GateWay	192.168.0.1
Display Setting Screen Display Mode	Horizontal C Vertical	
Description		
		OK Cancel

Set the **IP Address** and **Port Number** of the touch panel in this dialog box. If there is only one touch panel in your design and you will not use the function of indirect online simulation or download the project file to the panel via Ethernet, you can simply skip this step. If you use functions such as multi-HMI interconnection via Ethernet or Ethernet download, please allocate a unique IP address to your touch pannel according to the actual situations of the LAN (Local Area Network). If there is no conflict over the network, it is recommended not to change the default port number.

9. Double click the PLC icon, set **Station No.** to be the corresponding PLC station number.

PLC At	tribute	
PLC		
No.		
IP	192 . 168 . 0 . 128 Port 2007	
		OK Cancel

10. Set connection parameters:

Double click the HMI0 icon to show the **HMI Attribute** window. Click the Serial Port1 Setting tab, set the parameters of COM1 settings in this window (If the PLC is connected to COM0, please modify the parameters of COM0, as shown in the following figure:

HMI Attribute	9

				OK	Cancel	

In accordance with your PLC connection, set the **Type** to be RS232, RS485-4W or RS485-2W, and set other properties like **Baud Rate**. **Data Bits**. **Parity** and **Stop Bits**. **If you are not an advanced user, do not change the default settings in the right column.**

11. Select "File"-> **Save**" on the menu to save the project.

Select Tools → Compile, or press the Compile icon on the toolbar. After the compilation is completed, a message box "Compilation completed" appears in the Compilation Information Window, as shown in the following figure:

13. Select **Tools** -> **offline Simulation**, or press the **Offline Simulation** icon on the toolbar, as shown in the following figure.

Tools	(D)	Library(<u>D</u>)	Window(<u>W</u>)	Help(<u>H</u>)

Show Information Simulation Type: 0: [.pkg] File Path: f	fline Simulation \text_O1\text_O1.pkg	
Similarion Type.	fline Simulation \text_O1\text_O1.pkg	

Click **Simulate**, the simulation window of the empty project we have created appears, as shown in the following figure:

		R	/iew 🕤
Menu	Task B	T P A	

The project does not have any components and cannot execute any operations.

To exit the simulation program, right click in the simulation window area and click *close* or directly press the Spacebar .

2.2 Adding a Switch Component

▶ Part 2: Adding a switch component to the project.

1. In the **Project Structure Window**, select the HMI icon and right click, click **Edit Configuration** in the shortcut menu, as shown in the following figure:

• • • •	· · · · · · · ·	HN		· · ·	· · ·	1 m		· · ·	₿(¢oi		ac	tL	gi	X:
	Ne	et i	M	17430	7 %	Cut(<u>D</u>)		Ctrl+X							
•	•	L.				Copy(<u>⊂</u>)		Ctrl+C	•	•	÷	÷	÷	•	•

					. 🙈	Init.Boot W	Vindow								
				HMI	1	Import Rec	ipe			•	•	•			•
•	•	•	•			Edit	r.		•	·	÷	÷	·	·	·
•	•	•			83	Attribute	25		•	•	•	•	•	•	•
		•	•				.COV	10	•	•	•	•	•	•	•
•		•	1	•	• •	• • •	• •	• •	•	•	1	1	1	•	•

2. The program switches to the window editing mode, as shown in the following figure:

3. In the **PLC Components** frame in the graph element window on the left, click hold, drag and drop it to the configuration screen editing area. after dropping, the **General** dialog box in the **Bit Control Components** appears. Set the input/output address of the bit control component, as shown in the following figure:

Bit Display (Bit Display Component Attribution										
Basic Attri	Basic Attribution Bit Lamp Tag Graphics Position										
Priority Normal -											
- Input Addr	ess				Output Add	dress —					
НМІ	HMIO	•	PLC	0 -	нмі	HMIO	Ŧ	PLC	0	Ŧ	
Addr.Type	LB	•	Addr.	0	Addr.Type		Ŧ	Addr.	0		
Code Type	BIN	Ŧ	Forma	tDDDDD	Code Type	BIN	Ŧ	Format:	DDDDD		
WordNo.	1	Ŧ	🔲 Us	e Addr Tag	WordNo.	1	Ŧ	🔲 Usel	Addr Tag	,]	
Description	BLO										
										OK	

4. Switch to the **Switch** tab. Set the **Switch Type**. Select **Toggle Switch** from the list, as shown in the following figure:

Bit Setting Compon	ent Attribution 🛛 🔀
Basic Attribution	Bit State Setting Tag Graphics Position
Type On	
	OK

5. Switch to the Tag tab, select Use Tag, enter the texts corresponding to state 0 and 1 in

Content, and select the label color. (You can modify the alignment mode, font size and color of the labels)

Bit Setting C	omponent	Attrib	ution					×
Basic Attri	bution Bi	t State	Setting	Tag	Graphics	osition		
🔽 Use Tag	Language	Chinese	(PR China)	• 🗆	Use Text Labrar	у		-
Tag List								
State No.	Content		Align		Font Size	Font Color		
0			Left		16			
1			Left		16			
J								_
				_				_
						[OK	
						L L		

6. Switch to the **Graphics** tab and select the **Use Vector Graphics** check box. Select a wanted shape. Here, the switch shown in the following figure is selected. For the making of the vectogram, refer to Chapter 5.

Bit State Setting Component Attribute	X
Basic Attribute Bit State Setting Tag Graphics F	Position
Use Vector Graphics	
NUB_CTRL_BAR001.vg	
🔲 Use Bitm <mark>ap</mark>	
Import Graphics	
	Graphics State 0 🔹
	OK Cancel

7. Switch to the **Position** tab. There are four inputboxes showing the position and size of the part. "Left" inputbox holds the horizontal position of the upper left corner of the part, "Upper" inputbox holds the vertical position of that corner, the unit of these inputboxes is pixel. The origin of the screen is the upper left corner. So the "Left" value should not exceed the width

of the screen and the "upper" value should not exceed the length. For a screen of the resolution of 320*240, the maxim of "left" is 319 and the maxim of "upper" is 239. "Width" is the width of the part shown in the screen and "Length" is the length of it. Also, the maxim of these two inputboxes should not exceed the size of the screen.

8. Click **OK** to close the dialog box. The component in place is shown as follows:

- Select File->Save on the menubar, then select the menu Tools → Compile. If no error occurs during the compilation, the project is completed.
- 10. Select Tools → Offline Simulation → Simulation. Thus, you can view the switch you have added to the project. You may click it to switch between its ON/OFF state, which acts as the same as a real switch, as shown in the following figure:

		_	eview	•
		on		
Menu	Task B	_	T P A	

- 11. If you have set the IP address(see page 20), you may use the indirect online simulation.
- 12. Select Tools →Indirect Online Simulation. You may use your mouse to control the switch on the screen of your PC, and it can be found that the output point Q0 of the PLC can be controlled. You may use the output of the PLC to change over between the ON/OFF state of the switch. (See chapter 3 for detail of simulation)
- 13. Select **Tools** \rightarrow **Download**.
- 14. After download, reset the touch panel, and you can control the switch by touching the switch shown on the panel screen with your finger.
- 15. Up to now, the making of the switch is completed. The making of other components is similar. For details, refer to the introduction to related components in Chapter 6. For detailed operations of offline simulation and download, refer to Chapter 3.

Chapter 3 Description of the EV5000 Software

3.1 User Interface of EV5000

Run the EV5000 software, create an empty project by the procedures described in Chapter 2, the EV5000 interface will show the contents as shown in the following figure. The name and function of each item are described as follows:

You may also right click in the **View** or toolbar, to view the toolbars, as shown in the following figure:

Viev	V(V)	Tools(I)	Library(<u>D</u>)	$Window(\underline{W})$	Help(<u>H</u>)

a. Title bar

b. Menu bar

The menu bar provides menus for selecting various groups of commands. If one of these menus is selected, the corresponding dropdown menu appears. Each dropdown menu provides a group of related commands.

c. Basic toolbar

The basic toolbar provides tool icons like **Create Project, Open Project, Cut**, and **Paste**. For details, refer to the icon descriptions in Section 3.1.4.

d. Drawing toolbar

Each icon stands for a drawing function as it shows. The drawing tools include line tool, rectangle tool, ellipse/circle tool, arc tool, polygon tool and text tool. For detailed information, refer to Section 3.1.4.

e. Fill effect toolbar

This toolbar provides tools used for filling the screen background or areas within a enclosed barriers such as rectangle, ellipse and sector. Each icon represents a filling style. For details, refer to the descriptions in Section 3.1.4.

f. Position adjustment toolbar

It is used for adjusting the position of components, such as, Align Top, Align Bottom, Justify, Align right, Equal Size, Cascade, Group, flip, and so on.

For details, refer to the descriptions in Section 3.1.4.

g. System toolbar

It is used for compiling, downloading and simulating a project.

For details, refer to the descriptions in Section 3.1.4.

h. Line width toolbar

It is used for adjusting the line width.

For details, refer to the descriptions in Section 3.1.4.

i. Turn-to-page toolbar

It is used for scrolling forward and backward within the pages of a project. For details, refer to the descriptions in Section 3.1.4.

j. Database toolbar

It includes text library tool, alarm messages tool, address labels tool, PLC control tool and event messages tool.

For details, refer to the descriptions in Section 3.1.4.

k. Code compilation toolbar

It is used for controlling the compilation of codes.

For details, refer to the descriptions in Section 3.1.4.

I. Line style toolbar

This toolbar is used for selecting the line style: with or without an arrow, be a dotted line or solid line. The style of lines, arcs and the outline of rectangles are also set by this toolbar For details, refer to the descriptions in Section 3.1.4.

m. Graph element window

The Graph element window has five optional columns:

Connector: Used to select the type of communication link;

HMI: Used to select the HMI type;

PLC: Used to select the PLC type;

PLC parts: Used to select various configuration parts related to PLC registers;

Function parts: Used to select various functional parts.

n. Project construct window

The **Project construct window** shows the tree relationship between project windows and parts of the PLC and HMI in the entire project with a tree diagram.

For details, refer to the descriptions in Section 3.4.

o. Project files window

The **Project files window** indicates the relationship between the touch panel and bitmap files of the project in tree structure.

For details, refer to the descriptions in Section 3.3.

p. Compile information window

For details, refer to the descriptions in Section 3.5.

q. Component list window

For details, refer to the descriptions in Section 3.6.

r. Status bar

The **Status bar** shows the current mouse position, width/height of the target object, edit status, and so on.

s. Configuration window

The user can draw the configuration in this window.

Note: To change the color of the fonts and the fill color of the window and rectangles, directly

click the line color button

3.1.1 The File Menu

• New Project)

Select **New Project** in the [**File**] menu or click the icon 🛄 to create a new project.

Enter a project name, Press [OK], a new project will be created.

• Open Project

Select **Open Project** in the **File** menu, or click the icon to open an existing project.

• Files recently opened: the program automatically remember the most recently opened 3 files' name and path, the user can quickly open them in the "File" Menu.

Exit

Select Exit in the File menu to exit the EV5000 configuration software.

3.1.2 Edit

Undo

Use this function to undo the latest operation, the screen will return to the state before this

operation. click the icon **2** or select **Undo** in the **Edit** menu will activate this function.

Redo

Use this function to redo the operation which has just been undone by the Undo operation. Click

or select **Redo** in the **Edit** menu.

The Undo/ Redo support the following operations:

- 1. Drag a component from a component library window
- 2. Draw a static component
- 3. Move an object
- 4. Adjust the size of an object
- 5. All operations on the position toolbar
- 6. Line width, line style, and arrows
- 7. Fill style of an object
- 8. Frame color of an object
- 9. Fill color of an object
- 10. set to Top layer, set to bottom layer
- 11. Group and ungroup of multiple parts
- 12. Cut, copy, paste and delete of objects
- 13. Multiple copy

To add any component to the screen or to make any change to the screen, the user can use the **Undo/Redo** function. As shown in the following figure, add a switch component to the screen:

The switch part disappears, leaving a blank screen.

Then click Redo:

Press Undo:

The switch re-appears

The software supports the "**Undo/Redo**" operation of the latest ONE operation.

• Cut, copy, paste and delete

Select one or more components, you can conduct such operations as Cut, Copy and Paste. Their

corresponding icons are 📕 🗎 🛍 🥸. Their demonstration is omitted here.

• Nuage

Select a part, the position of the object can be adjusted by using the Nuage tools, or you can use the **Nuage** icon to move the component. Every time when you click **Tune**, the component will move by the distance of one pixel. Its corresponding icons are **Here Here 1**, respectively indicating **Move Left by One Pixel**, **Move Right by One Pixel**, **Move Up by One Pixel**, and **Move Down by One Pixel**, which correspond to the contents of the **Nuage** in the **Edit** menu one by one. A simple method to use the "Nuage" function is to use the direction keys of the keypad, to move the component conveniently.

• Align

It is used to implement the Justify the alignment of multiple parts. With the Alignment tools, users can Align right, Align Top, Align Bottom, Vertical Center and Horizontal Center. Their corresponding icons are

• Layer

If multiple components are overlapped, you can use the icons (Top, Bottom) or selectSet Top Layer andSet Bottom Layer in the Layer submenu in the Edit menu to change the layer sequence of the components.

First select a component, then click the related icon to set the component to the expected layer. The components on the top layer are always displayed above the components on the layers below.

• Group/Ungroup

This function can be used to group multiple selected components or shapes, so that they can be used as a single component. To group multiple components, select these components, and then select **Group** in the **Edit** menu or click the icon **II**. To ungroup, select the grouped entity, and

then select **Ungroup** in the **Edit** menu or click the icon **II**.

• Equal horizontal space

This function can be used to implement the equal horizontal space between multiple selected components and shapes. First, select a shape or component to be operated, and then select **Equal Horizontal Space** in the **Edit** menu or click the icon **Equal Horizontal Space**. The effect is as follows:

• Equal vertical space

This function can be used to implement the equal vertical space between multiple selected components and shapes. First, select a shape or component to be operated, and then select **Equal Vertical Space** in the **Edit** menu or click the icon

• Horizontal center

This function is used to place multiple selected components or shapes in the horizontal center position of the window. First, select a shape or component to be operated, and then select **Horizontal Center** in the **Edit** menu or click the icon —, as shown in the following figure:

• Vertical center

This function is used to place multiple selected components or shapes in the vertical center position of the window. First, select a shape or component to be operated, and then select **Vertical Center** in the **Edit** menu or click the icon **I**. The figure is omitted.

• Flip and Rotate

Only shapes drawn by drawing tools can be flipped, such as straight lines, circles, and polygons. Other components cannot be flipped. First, select a shape to be flipped, and then select **Flip**

flip the component.

3.1.3 View

The **View** menu provides control over the display of various toolbars and windows. To make the expected toolbars and windows visible in the user interface, check the corresponding item on the **View** menu.

• Standard toolbar: As shown in the figure, the contents of the standard toolbar correspond to the contents in the menu in turn:

New Project: Create a project;

Open Project: Open an existing project;

Save: Save the current project;

Save All Active Files: Save all the currently opened active files;

Cut: Cut;

Copy: Copy; Paste: Paste; Multiple Paste: Multiple copy; Delete: Delete a component; Cancel: Cancel the latest operation; Restore: Restore the latest cancelled operation; Print Preview: Print preview; Print: Print; Properties: Display the properties of an object; Show Component Name: Show the name of a component; About: EV5000 version description.

• Multi-Copy

This function is used to make multiple copies of selected parts, which can save more time. Select components, and click the icon to copy multiple components, as shown in the following figure:

.S'	WO				
	on				
	•	·			

•										
	S١	NO		SW	/1		SW2	•	_

~	SWO(LBO LB) (Bott	om layer)	OK Cancel	

A configuration window appears for entering the copy quantity, interval of the copies and some other options.

Attribution: To change the attributions of a component, select the component, double click it or click the icon she Properties dialog box of the component appears. The user can make editing in this dialog box.

• **Database Toolbar**: As shown in the following figure, the contents of the items in the menu correspond to each other, which are as follows in turn:

Create a new graphic

Text Library: Stores text tags;

Address tags: Stores address tags

Alarm Information Logon: Enter alarm messages;

Event Information Logon: Enter event messages;

PLC Control: Adds PLC control components;

(New Graphics): Creates a vectogram or a bitmap;

(Import Graph Library): Imports a vectogram or a bitmap;

(Add Macrocode): Adds a macrocode;

(Import Recipe Data File): Import a Recipe data file;

(Edit Intitial Window): Click this button to switch the window to the startup screen edit window, where you can edit the initial display window upon the power-on startup of the HMI panel, as shown in the following figure:

The default initial window is the logo of Kinco Electric Ltd.

• Line style toolbar: As shown in the following figure, the contents of the items in the menu correspond to each other in turn:

• Position adjustment toolbar

(Move Left by One Pixel): Sets a component to move left by one pixel;
(Move Right by One Pixel): Sets a component to move right by one pixel;
(Move Up by One Pixel): Sets a component to move upward by one pixel;
(Move Down by One Pixel): Sets a component to move downward by one pixel;
(Left): If the text content exceeds two lines, the text lines will align to the left(also applicable to

components).

(Align Right): If the text content exceeds two lines, the text lines will align to the right (also applicable to components).

(Align Top): Sets multiple components in top alignment mode.

(Align Bottom): Sets multiple components in bottom alignment mode.

(Vertical Center): If the text content exceeds two lines, the text will be arranged in the vertical center alignment mode (also applicable to components).

(Horizontal Center): If the text content exceeds two lines, the text will be arranged in the horizontal center alignment mode (also applicable to components).

(Equal Width): Sets equal width for multiple components.

(Equal Height): Sets equal height for multiple components.

(Equal Size): Sets equal size for multiple components.

(Top): Sets a component to be located in the topmost layer.

(Bottom): Sets a component to be located in the bottommost layer.

(Group): Includes multiple components into one group.

(Ungroup): Dissects the grouped parts into multiple discrete parts.

(Equal Horizontal Space): Sets equal horizontal space for multiple components.

(Equal Vertical Space): Sets equal vertical space for multiple components.

(Flip Vertical): Flip up/down.

(Flip Horizontal): Flip left/right.

(Rotate for 90°): Rotate for 90 degrees counter-clock wisely.

Tag Position toolbar

💶 🗈 🔒 堤 🖶 🖕

Some component has a tag on it. By default, the tag is in the center of the component. But when the component has been stretched or resized, the tag may no longer lay in the center. To position the tag more precisely, click the tag to select it, then the tag position tools are enabled. The tools listed here are: Align the tags to the left, to the right, to the top, to the bottom, align horizontal midline and align vertical midline.

• Drawing toolbar

The contents of the drawing toolbar are arranged in the following order:

Select: Selects a single component;

Straight Line: Draws a straight line;

Curve: Draws a curve;

Rectangle: draws a rectangle;

Rounded Rectangle: Draws a rounded rectangle;

Polyline: Draws a continuous straight line;

Polygon: Draws a polygon;

Circle/Ellipse: Draws a circle/ellipse;

Sector: Draws a sector;

Text: Adds a text;

Picture: Imports a picture to the bitmap library;

Line Color: Sets the color of a line;

Fill Color: Sets the filling color;

Background Spacing Point: Sets the background spacing point;

Transparent Color: Implements transparent color effect of an added bitmap;

Gray Scale: switches the bitmap between color and gray.

Compile & Download C	ption

In the palette of color-related tools, we provide 40 optional colors, as shown in the following figure:

In addition, besides the 40 colors listed above, you may make a customized setting of the color. Select **Custom**, and the following dialog box appears:

In this dialog box, you may customize any shape color you want. we provide more color schemes in the color properties list.

🍓 Filled	Color	
Colors:	basic colors	•
	basic colors hue, saturation and luminance - mixer hue, saturation and luminance - basic hue hue, saturation and luminance - roller red, green and blue - cube red, green and blue - mixer gray scale mixer cyan, magenta and yellow - cube cyan, magenta and yellow - cube cyan, magenta and yellow - mixer red axis green axis blue axis cyan axis magenta axis yellow axis	
	New	
0	Cancel Current	

The users can customize their own color when needed.

Selecting components

Methods for using selecting components:

- 1. **Directly select:** Click a component to be selected directly;
- 2. Select all components: Select Select All Components in the Edit menu, and all components in the current screen will be selected.

When the direct select tool is activated, Click a component, with the Ctrl key hold will make a copy of the component .

Note: To select multiple components or to enter the multiple selecting mode, drag the mouse and select at least one part, then press and hold the [**Shift**] key, additional parts can be selected.

• Modifying part size

You can click a component to change its size in the following method: Click to select a part, select anyone among the eight green pints of the component, and drag with your mouse, as shown in the following figure:

• Part Fill and Frame:

To change the change the color of the part outline or the filling color, select a component, and click the arrow after **Color** icon to change the frame color. To change the fill color, click the arrow after the black box, as shown in the following figure:

noFrame								
	Cust	tom	Colo	r				

• Text

Click the text icon A, the text dialog box appears, as shown in the following figure:

Text Attribute				×
Text Position

Language	Chinese(PR	Ŧ		~
	Color	•	<	N
				OK

Font Size: 8, 16, 24, 32, 48, 64, 72 and 96 pixels are optional.

Align: The text alignment mode can be Left, Right, and Center.

Color: Indicates the text display color.

Content: Shows the text content on the part. When using the text library, the text content can only be edited in the text library. For detailed description of the text library, refer to Section 6.33 in Chapter 6.

Picture

This icon can be used to add pictures when creating bitmaps. For related contents, refer to Section 5.6, "Bitmap".

Switch page Toolbar

Add Window: Adds a configuration window;
Previous Page: Goes to the previous configuration window;
Current Page: Shows the current configuration window;
Next Page: Goes to the next configuration window;
Zoom in: Zooms in the current window;
Zoom Multiple: 100%, 200% and 300% are optional
Zoom out: Zooms out the current window.

• Line style toolbar

It is used to select the line width, the number indicates the pounds of the line width.

• System toolbar

Compile: Compiles the current project and checks whether there is any error. Projects have to be compiled before download or simulation, or the download and simulation tools are disabled.

Download: Downloads a project to the HMI panel;

Offline Simulation: Used for offline simulation of a project;

Indirect Online Simulation: Used for indirect online simulation of a project;

Direct Online Simulation: Used for direct online simulation of a project;

• Code editing toolbar

Add Bookmark: Creates a new bookmark;

Next Bookmark: Shows the next bookmark;

Previous Bookmark: Shows the previous bookmark;

Delete Bookmark: Deletes a bookmark;

Variable Edit Window: Opens or closes the variable edit window.

• Fill Effect Toolbar

It is used to select various filling effect shapes. The filling patterns above can be used for shapes like rectangle, ellipse and sector. The background of configuration window can also be filled with these patterns.

To fill the current window, double click the window to show the properties window. Select **(Use Background Fill Effect**), as shown in the following figure:

Window Attribution		×
Window		
Na Frame0	No. 0 Safe Level Lowe -	
Special Attribute	Print page 👻 🔲 Disable Map Keyboard	
Position	Use Background Color	- I
:× 0	Y D	
Width 320	Height 240 Transparence 0% -	
Bottom Window		5
1 None	▼ 2 None ▼ 3 None ▼	
Frame Width 0	Frame Color Frame Color Clipping Coherence	
	OK	

Select a fill color and background color, and then select a fill style, as shown in the following figure:

To fill a shape, select the shape to be filled, then click one of the above fill style icons. The method is the same as that for filling a window. The only difference is that, for a component, the line color is the line color of the pattern, while the fill color is the pattern background color, as shown in the following figure:

 Status bar 	
	Mouse[x=256 y=42]

The stats bar shows the current mouse position, the width and height of the selected object, edit state, and other state information.

3.1.4 Tools Menu

As shown in the following figure, for the contents of the **(Tools)** menu, please refer to related descriptions in Sections 3.5, 3.7, 3.8 and 3.9.

Tool	$s(\mathbf{I})$ Library(D) Window(V	/) Help(<u>H</u>)
	$\overline{Compile}(\underline{C})$	Ctrl+F7
ð	Download(<u>D</u>)	Ctrl+D
$\overline{\sim}$	Offline Simulation(E)	F5
	Indirect Online Simulation	Shift+F5
	Direct Online Simulation(\underline{N})	Ctrl+F5
	Options(<u>O</u>)	Alt+F7

3.1.5 Project Database

As shown in the following figure, the **Library** menu provides eight items. For the details, refer to related descriptions in Chapter 5 and Chapter 6.

3.1.6 Window

Click **Window** in the main menu bar, and the following dropdown menu appears. The functions of **Cascade**, **Tile Horizontally** and **Tile Vertically** are respectively as follows: **Cascade** is used to display windows in a cascade sequence, **Tile Horizontally** is used to display a window in Horizontal tile mode, and **Tile Vertically** is used to display a window in vertical tile mode.

The Tile Horizontally window is shown as follows:

НМІО				_																10

3.1.7 Help

Users can find software version information here.

3.2 Graph element Window

By default, there are three important windows displayed within the EV5000 user interface. They are not real "windows". The definition of "window" will be described in the next chapter. The "window" here refers to a special area related to all components of a project. The three "windows" provide global information of the whole project. The three windows are, **Graph element Window**, **Project File Window**, and **Project construct Window**, which will be described one by one in the following.

The Graph element Window includes (Connector), (HMI), PLC, (PLC Parts), and (Function Parts).

(Connector): Includes serial port connection (Serial) and Ethernet connection (Ethernet).

(HMI): All models of eView MT4000 and MT5000 series HMI panel are listed here, the users should select the proper model in accordance with the actual panel for their projects;

PLC: All the PLCs supported by eView HMI panel system are listed here; the user should select the proper model in accordance with the actual PLCs for their projects;

(PLC Parts): All the parts related to PLC registers are listed here, including **Bit Setting Part**, **Switch, Multi-state Display Part**, **Trend Graph Part**, **XY Plot Part**, **Numeric Input Part**, **Text Input part** and so on;

(Functional Components): Parts for special functions are listed here, including Function Key Part, Scale Part, Alarm Bar Part and Timer Part

Usage:

(1) **Connector**:

If you select **RS232** or **RS485**, click [**Serial**] icon, drag it to the **Project Window**. If you want to use the Ethernet connection, click the Ethernet icon then drag it to the Project Window. When dragging, the icon will appear like a wire. After dropping it, the wire will stay in the Project Window.

(2) **HMI**:

Identify the model of the actual HMI panel you are currently using, click the corresponding icon and drag it to the **Project Window**.

Caution: Make sure that the selected HMI model is consistent with your hardware model.

(3) **PLC**

Identify the model of PLC currently being used, click the corresponding icon and drag it to the **Project Window**.

After selecting the PLC, HMI and communication connection, connect them properly. (Drag the PLC and HMI icon to make the wire ends attached to the ports automatically. Click and drag the wire ends towards the ports will yield the same result. To make sure the connection is established, drag the HMI or PLC icon, the properly attached wire ends will move with the mouse.)

Note: If there isn't any PLC or HMI in the Project Window, the Project File Window and the Project Construct Window will be blank, as shown in the following figure:

Once the PLC and HMI icons are dragged into the project window, related information will be displayed in the **Project File Window** and **Project Construct Window**, as

shown in the following figure:

🔆 - [HMI1.whe]

(4) PLC parts

It includes various configuration parts, as shown in the following figure:

After creating a project and switch to the configuration screen edit window, you can drag parts to be used into the configuration window. For the detailed instruction for using the PLC parts, please refer to Chapter 6.

(5) Function Parts

Function parts include **Function keys, Scale, Alarm Bar, Timer**, and so on. For the usage of them, please refer to Chapter 6.

Caution: In the Graph element Window, right click, and select **Small Icon** in the shortcut menu, the icons will be displayed in the form of smaller icon, which can save the window area for small displays, as shown in the following figure:

		PLC Parts

💺 Number Input	input Text Input	🖲 Oscillograph	🥪 Video	🧑 Note Book

3.3 Project File Window

Files related to shape library and HMI panels are displayed in the **Project Files Window**, so there are two branches in the tree structure: HMI and Graphic Library.

HMI:

The HMI folder contains *.whe file which is corresponding to the HMI icon in the Project Window, For the first HMI panel, HMI0, the file is HMI0.whe, for HMI1, the filename is HMI1.whe. If there are three HMI panels in the project, there are three *.whe files, HMI0.whe, HMI1.whe and HMI2.whe. Double click the *.whe file will expand it, macrocode file and recipe file attached to the HMI panel will appear.

Click the symbol "+" or "-" in the left of the icon to expand or collapse the directory tree. To edit the file in the folders, double click it.

Caution: The configuration recipe file (.RCP) can only be imported and deleted, but cannot be edited. To edit such a file, use other binary editing software.

Shape Library:

Shape Library folder contains all the vector graph and bitmap files imported to the current project. Vector graph files are shown as *.vg files and bitmap files are shown as *.bg files. For the description of vectogram and bitmap, please refer to Sections 5.5 and 5.6 in Chapter 5.

3.4 Project Window and Project Construct Window:

The **Project Window** is used to show the structure of the entire project. HMI panels, PLCs and connection wires are shown in this window, as shown in the following figure:

1.1		• •	•		· ·	1	· ·	1	1	· ·		· ·		•		•	1			•	•	•

HMI: One HMI icon represents one actual HMI panel, the number after HMI helps the user distinguish those panels. Right click on the HMI icon will popup its own shortcut menu, the user can select in the menu to take expected operations on the corresponding panel.

PLC: One PLC icon represents one actual PLC. The number after PLC helps the user distinguish those PLCs. Right click on the PLC icon will popup its own shortcut menu and the user can select in the menu to edit the attribution of the corresponding PLC.

Wire: The wires shown in the Project Window represent the physical connection between HMI and PLC. See page 59 for detail of connecting HMI and PLC.

The structural diagram is as follows:

The detailed structure is shown in the Project Construct Window as follows:

See the figure above, the icons labeled "FrameX" represent the configuration windows of panel marked as HMI1. "DW0" and "DW1" in the above figure represent parts in Window 1. The "+" symbols indicate windows containing parts, click on the "+" will expand the tree and make the parts of that window visible. Windows containing no parts don't have that "+" symbol and can not be

expanded. To collapse the expanded tree, click on the "-" symbols. If the user want to delete some windows or parts, click to select and press DELETE key on the keypad, the selected frame or part will be deleted.

PLC Attribution:

PLC Attribution X PLC Attribution X PLC 站号 No. III IP 192.168.0.128 Port 2007 <	· com0	PLC1:100 Siemens S7		LC1:0	LC2:0.	 IS ASCII
		PLC No.	on PLC 站书		·	

The first digit indicates the number of PLC, that is, the number designated to the PLC. The digit after the colon indicates the station number of the PLC.

3.5 Compile Information Window

The **Compile Information Window** displays the complie progress and the compiling results, indicates the errors when they occur, as shown in the following figure:

Message winodow	x
Compile	^
Compile HMIO	
WindowFrameO	
WindowFrame1	
WindowFrame2	
WindowFrame3	
WindowFrame4	
Word Labrary	
Graphics Labrary

Connecting	
Compilation Done! Error O!	
< <u>></u>	

When a project is open, the Compilation Information Window will display the loaded information of the project. When a project is being compiled, the Compile Information Window will display the compilation progress and error messages if there are any.

3.6 Component List Window

Select Component List Window under the View menu to open the Component List Window.

The window shows the information of all parts used in the project, including HMI panel number, configuration frame number, part number, input PLC number, type of input address, input address, output PLC number, type of output address and output address. Double click an entry will lead to the configuration frame where the part is.

3.7 Offline Simulation

The EV5000 provides offline simulation function. During offline simulation, the program does not accquire data from the PLC, but only read data from the local address. Therefore, all data displayed on the configuration windows are static data. With the offline simulation, the user can conveniently preview the configuration effect, without the need to download the program to the touch screen every time. Therefore, lots of time for downloading is saved.

Select **Offline Simulation** in the **Tools** menu, or click the icon, the following dialog box appears:

HMI Station	HMI	Information		Simulat
HMIO HMI1				Exit
<			>	
Simulation Serial	Port]
HMI(COMO) _{COM1}	Ŧ	HMI (COM1) COM1	Ŧ	
			Ŧ]
Show Information-	• Offline Sin		·	
Show Information— Simulation Type:	Offline Sir		·	
HMI (COMO) _{COM1} Show Information- Simulation Type: [.pkg] File Path:	Offline Sir	mulation	v	
Show Information— Simulation Type:	Offline Sin E:\text\tex	mulation	* 	
Show Information— Simulation Type: [.pkg] File Path:	Offline Sin E:\text\tex	mulation	*	

Select an HMI to be simulated, and click **Simulate**, the offline simulation screen of the selected HMI panel appears.

3.8 Online Simulation

The EV5000 provides online simulation operation. With the online simulator, a project can be simulated on the PC and the configuration simulation screen acts as the actual panel. The simulator exchange data with the PLC (via MT4000/5000 HMI panel connected to the PC in the indirect mode). The data displayed on the simulator screen is the actual data from the PLC registers. Using online simulator when debugging the configuration project can save much time for downloading. The online simulation function has two modes: direct and indirect, which will be explained in detail in the following paragraphs.

3.8.1 Direct Online Simulation

In direct online simulation mode, the PLC is directly connected to the serial port of PC running the simulator. Its merit is that the PLC data can be obtained dynamically, without the transfer and possible delay of the HMI panel. The user can even create and evaluate the configuration project without an actual panel on hand, which can save the cost for a potential client who just want to try before purchasing. The shortcoming is that only the PLC with an RS232 interface can be used in this mode. To debug the PLC with an RS485 interface, an RS232-to-485/422 interface convertor is required.

Note:

1. The maxim test time for the direct online simulation is 15 minutes. After 15 minutes, the system will prompt "simulation timeout, please simulate again", and the simulator will shutdown automatically.

2. Only the RS232 communication mode can be used for direct online simulation. After the compiling configuration project and establishing the physical connection between PLC and

HMI Station		HMI Info	rmation		Simulat
HMIO HMI1					Exit
<	1111			>	
Simulation Serial HMI(COMO) _{COM1}	Port —	HMIÓ	COM1) COM1		
			COMI		
Show Information-					
Simulation Type:	NULL				
Simulation Type: [.pkg] File Path:	NULL				
	NULL				

PC, click the 🔯 button, the following dialog box appears:

Select the touch panel to simulate, select the COM ID of the computer to be connected to the PLC, and click **[Simulate]** to start direct online simulation.

Note: Use the programming cable of PLC to connect PLC and PC and perform the simulation.

3.8.2 Indirect Online Simulation

In indirect online simulation mode, the simulator exchanges data with the PLC via the HMI panel connected to PC. The simulation screen acts as the actual panel, clicking on the screen is the same as touching the real panel. With indirect online simulator, lots of time for downloading is saved. The user have to have the proper panel to perform the simulation. Connect the panel to PC with USB cable or MT4000/5000 downloading cable or Ethernet cable. Connect the PLC to the panel with the required communication cable. For more information about the communication cable, refer to chapter 14.

After the compiling the project and connecting the PLC, HMI panel and PC properly, click the button, the following dialog box appears:

HMI Station		HMI Info	rmetion		Simulate
HMIO HMII		Juit III.			Exit
<	1111			>	
Simulation Serial HMI (COMO) _{COM1}	Port —				
TINT (CONO) COM1	Ŧ	HMI ((COM1) COM1	Ŧ	
Show Information — Simulation Type:	TUIL	HMI((COM1) COM1	Ŧ]
Show Information-	NULL	HMI((COM1) COM1	*	
Show Information— Simulation Type:	NULL	HMI((COM1) COM1	·	

Select an HMI to be simulated, click [Simulate] to start simulation.

1. The MT5000 panels can perform indirect online simulation via the Ethernet, USB or serial port.

2. The MT4000 panels can perform indirect online simulation via the USB or serial port.

3.9 Download

After a project is compiled, it can be downloaded to the touch panel for actual operation. The MT5000 panels provide three download methods: USB, Ethernet and serial port. The MT4000 panels provide two download modes: USB and serial port. Downloading via the Ethernet is the fastest way, while downloading via the serial port and USB is a bit slower. Before download/upload, the users must set the communication parameters first. Set the communication parameters in the **Setting Option** submenu in the **Tools** menu in the menu bar, as shown in the following figure:

Tool	s(I) Library(<u>D</u>) Window(<u>W)</u> Help(<u>H</u>)
[×]	Compile(⊆)	Ctrl+F7
ð	Download(<u>D</u>)	Ctrl+D
~	Offline Simulation(E)	F5
	Indirect Online Simulation	Shift+F5
	Direct Online Simulation(<u>N</u>)) Ctrl+F5
	Options(<u>O</u>)	Alt+F7

Then, the following dialog box appears:

1) Download through USB cable

Compile & Download O	ption			
нмі Нміо Нмі1	Compile) (Size>	1024	Byte)
	Download			
	Download Device	USB 🝷		
	Serial No.	COM1 🔹 👻		
	IP Address	192 168	0	253
	Port	21845		J
	Screen Grid Space			
	X: 20	÷	r: 20	÷
		OK		Cancel

A USB cable is included in the package of MT5000/4000 panel. Connect MT5000/4000 panel to the USB port of the PC with that cable before download.

 The USB-client port on the MT4000/5000 panel can only be used for uploading/downloading configuration package file and the logo file or setting the system parameters of the HMI panel. Other USB devices such as printers and USB mass storage devices are not supported.

When using USB downloading cable for the first time, the user should install the USB device driver manually. Connect the panel and the PC with the cable fist, power on the panel. The windows OS will report that the system had just found a new hardware and start the wizard as the following figure shows. The user can finish the installation by following the instruction below.

~~	Hardware Installation								
	The software you are installing for this hardware: eview USB								
	has not passed Windows Logo testing to verify its compatibility with Windows XP. (<u>Tell me why this testing is important</u> .)								
	Continuing your installation of this software may impair or destabilize the correct operation of your system either immediately or in the future. Microsoft strongly recommends that you stop this installation now and contact the hardware vendor for software that has passed Windows Logo testing.								
	Continue Anyway STOP Installation								

Once the driver is installed successfully, the user can select **My Computer** \rightarrow **Properties** \rightarrow **Hardware** \rightarrow **Device Manager** \rightarrow **Universal Serial Bus Controller** to check whether the USB device is connected to and identified by the PC, as shown in the following figure: (The **EVIEW USB** appears only when the DIP switches 1 and 2 in the rear of the touch panel are set to "**OFF**".) To configure the DIP switches, remove the lit on the back of panel.

Once the driver has been installed successfully, no more settings is needed. The user can use the eView USB device after connecting and powering on the panel. To download through USB cable, select "USB" for **Download Device**, as shown in the following figure:

Compile & Download Option 🛛 🛛 🔀									
нмі Нміо Нміі	Compile	p (Size>	1024	Byte)					
	Download Download Device	USB 🔻							
	Serial No.	COM1 ×							
	IP Address Port	192 168 21845	0	253					
	- Screen Grid Space-	21045							
	X: 20	÷	Y: 20	÷					
		OK		Cancel					

Compress Large Bitmap: In the numeric input box, the user can specify the limit of the original file size of the bitmap which is imported into the project. The file size is counted by bytes. When the bitmap file exceeds that limit, the complier will compress the bitmap for downloading. Compression will save the storage space on the panel. This option is selected by default.

2) Ethernet (For MT5000 panels only)

The Ethernet interface can be used for the downloading of the HMI configuration, the setting of the HMI system parameters, and the indirect online simulation of the configuration. Furthermore, multiple HMIs can be interconnected via the Ethernet to form a multi-HMI application.

Compile & Download O	Compile & Download Option									
НМІ НМІО НМІ1	Compile	np (Size>	1024	Byte)						
	Download Download Device Serial No. IP Address Port	Ethernet • COM1 • 192 168 21845	0	253						
	Screen Grid Space	A V	Y: 20	÷						
		OK		Cancel						

IP Address: Refers to the IP address of the HMI to be downloaded. In addition to this IP address, the IP address of the PC should also be set. The two IP addresses should be in the same network section, that is to say, the range of the IP address of your PC is: 192.168.0.1 \sim 11/13 \sim 255. To implement normal download, the IP address of the HMI should be different from that of the PC.

Port No.: A network is actually composed of seven layers of protocols. One of the most important tasks of the Transport Layer is to provide a reliable end-to-end connection. Where, the "end" here means the port. Of course, there are many ports, ranging from 0 to 65535. The TCP/IP protocol has many ports. All the ports less than 1024 have clear definitions. You are recommended to use ports above 1024. Set such a port to a port used for the touch screen. Anyway, please make sure that your PC allows the use of this port. The setting procedure for the PC port is as follows:

Network Connections (right click) \rightarrow Properties \rightarrow Local Area Connection (right click) \rightarrow Properties \rightarrow Internet Protocol (TCP/IP) \rightarrow Properties \rightarrow Advanced \rightarrow Options \rightarrow Enable TCP/IP Filtering \rightarrow Properties

For details, refer to the following figure:

	OK Cancel	

2. This port can be connected to a HUB or a SWITCH via a standard Ethernet cable (RJ45 straight-through cable) to access the LAN (Local Area Network), or can be directly connected to the Ethernet port of the PC via an interconnection cable (RJ45 cross-over cable).

The network interface of the PC is directly connected to the touch screen via a cross-over cable. Then, it is connected to the touch screen through the HUB via a straight-through cable.

3. If a user has enabled the firewall, an alert box will appear to ask which port the user wants to access. Select **"Enable"**, and download can be made. If all ports are disabled, disable the firewall.

4. The touch screen is directly connected to the network interface of the PC, and the IP address of the PC should be changed to an address different from that of the touch screen. If the IP address of the touch screen is 192.168.0.253, then IP address of the PC should be changed to 192.168.0.X. The first three digits should be the same, and the last digit should be different.

2) Downloading through Serial port

To use serial port as the downloading method, select "Serial Port" in the list, as the following figure shows:

Compile & Download	Option 🔀
HMI HMIO HMI1	Compile Compress Bitmap (Size > 1024 Byte)
	Download Download Device Com
	Serial No. COM1 • IP Address 255 255 255
	Port 21845
	Screen Grid Space
	X £° 20 € ¥£° 20 €
	OK Cancel

Serial Port No.: Select a serial port you want to use. Make sure the port you designate is available and the downloading cable is connected properly. The user can contact with Stepservo Ltd or local distributor to get the serial downloading cable.

Note: Due to the low downloading speed, downloading through serial port will take a long time to wait, thus it is not recommended as the downloading channel.

After selecting the downloading method and setting the required parameters, you can start

downloading by click the icon . A dialog box will pop up after clicking the download icon. According to the method you select, the dialog box looks a bit different, as the following figures show:

📥 EVDownload

COM: NULL		BPS:	NULL	Exit

Except the downloading-method-related parameters displayed in gray boxes, there are some options the users can set and should pay attention to.

Select Section

The files to be downloaded to the panel are of three types: User Data File, Recipe File and Logo File. The user can select any one of these files to be downloaded, which makes the downloading more flexible and avoid wasting time for unnecessary download. The following paragraphs give an introduction of these files.

User Data File: The configuration project files, including all the data of the configuration windows and images, are packaged into a single user data file after being compiled. The extension of the file type is .pkg. Only after the *.pkg file has been downloaded, the panel can run the configuration project designed by the user.

Recipe File: This option is only available when there is a recipe file imported into the project and affiliated to an HMI panel. The recipe file is stored in one SRAM chip on the mainboard of the panel, with a backup battery to keep the data when the power is off.

LOGO File: Logo is the first picture displayed during the power-on stage, when the embedded system has not been booted. So the picture is different from other pictures displayed in the configuration windows. By editing the initial window, the user can create his own logo file, whose expansion is *.logo. When the user want to change the current logo, he must edit the initial window in the project and compile the project, then select the Logo File check box and download the file to the panel. Once the logo file has been downloaded, there is no need to download everytime if the user doesn't want to change it. The logo will be displayed everytime the panel is powered on. By default, the checkbox for logo file downloading is unselected.

How to make your own logo?

Create a new project or open an existing one, make sure there is an HMI icon in the Project Window. Click the A icon on the toolbar, or right click HMI icon in the Project Window to enter the initial starting window edit window, as shown in the following figure:

By default, there is a logo picture of Stepservo Ltd in the editing window. The user can replace it with his own logo or other desired picture. To import an user-defined picture, click the *k* icon on the toolbar, and the following dialog box appears:

Open 🥐 🔀
Look in: 🧀 111111 💽 🔶 🛍 🕂 🏢 -
 ➢ HMIO ➢ vg ➢ hmi1 ➢ image ➢ New Folder ➢ tar ➢ temp
File name: Open
Files of type: Graphics File(*.bmp; *.gif; *.jpg) Cancel

Find your company's logo image and click **Open**. The supported image format is bitmap, JPEG image and GIF image, and the image to be imported as the logo should not larger than the size of the panel. (For MT4300/5300, the size is 320*240, for MT4400/4500/5400/5500, the size is 640*480.) In the following figures, we use the logo of Stepservo as an example:

Open		? 🛛
Look in: 📳 My Pictures		- 🗢 🗈 💣 🎟
<mark>ビージン Kinco</mark> 参科电气 defaultlog	Sample Pictures	
File name: defaultlog		Open
Files of type: Graphics File	(*.bmp; *.gif; *.jpg)	▼ Cancel

After selecting the image and click "Open", the logo image is imported into the editing window and you can ajust the size and position of it. When the adjustment is done, save it and close the window to return to the project window. Connect the HMI panel and PC, compile the project and click "download" icon, the dialog box we have discussed above appears:

elect HMI:					-Select Section: -
HMI Station	HMI Information				🔽 Data File

	ОК	Cancel

Reset the panel, it will show the logo just been downloaded during the power-on stage. If no logo file has been downloaded, the panel will display "LOGO Error!" instead.

Chapter 4 Configuration Windows

4.1 Window Type

Window is the basic elements of an EV5000 project. Each display is composed of a number of windows. There are three types of windows: Basic, common and fast selection. A basic window can be used as a pop-up window after changing its size. All windows can be assigned as underlay windows.

- **Basic window:** Basic window is the normal type of window that would be displayed during HMI runtime. When using (Change Window) command to switch to a basic window, the current screen will be cleared (all windows except the common window and fast selection window will be turned off). When the parts in the base window invoke the pop-up window, the original information of the base window will be kept, while the invoked pop-up window will be attached to the current base window. The relationship between all such pop-up windows and the base window is a kind of father-son window relationship. Upon the switchover from base window N to base window M, all sub-windows of window N will be closed, while window M and sub-window of window M are displayed. The base window should be of the full-screen size.
- **Fast selection window:** The fast selection window is a window activated by touching the task button. This window will be always displayed on the screen unless it's hided by a task button. So it can be used for placing function keys which switch over windows or other commonly

used objects. By default, Window 2 is the fast selection window. If another window is set to be the fast selection window, the window should be of the same size as the fast selection window.

- **Common window:** The common window will always be displayed on the screen. A part to be always displayed can be placed in the common window. Thus, you can view the state or operation of the component at any time. By default, Window 1 is the common window. The function key **Change Common window** can be used to change other window to be the current common window. However, there is only one current common window.
- Bottom Window: A maximum of three underlay windows can be set for the window in the Window Properties dialog box. Normally, the bottom window is used to store common components shared by multiple windows, such as background images, graphs, titles and so on. Any window can be set as a bottom window.

Window Attribution	Ε
Window	
Na Frame0	No. 0 Safe Level Lowe -
Special Attribute	Print page 🝷 🔲 Disable Map Keyboard
Position	Use Background Color
:× 0	Y 0 Filled Color * Background *
Width 320	Height 240 Transparence 0% -
Bottom Window-	
1 None	▼ 2 None ▼ 3 None ▼
Frame Width 0	Frame Color ▼ Pop Window Type ✓ Tracking Monopoly ✓ Clipping Coherence
	OK

As shown in the figure above, you can select a bottom-layer window for the window in the **Bottom Window** option. A bottom-layer window is different from a common window. During runtime, the components of the bottom window are inserted into the general window, but actually this bottom window is not displayed. The display and control of components of the bottom window are the same as that of the general window. The bottom window is something like "transparent" for the panel users, The users operate the parts on the bottom window while they think they are touching the parts on the general window above the bottom window.

Relationship between screen and window: A screen can include: a common window, a base window and a fast selection window, while each common window or base window can include multiple pop-up windows. Their relationship is shown as follows:

When the window switchover command is executed, the panel screen will clear all the current windows (including the pop-up windows attached to the current basic window), and switch over to the window to be displayed. However, the common window will always be displayed on the screen. A pop-up window invoked by a direct or indirect window will not change the original contents of the base window, and it is only attached to the base window. In the window property setting dialog box, each window can be configured with a maximum of three bottom windows.

When a base window is invoked (the window number ranges from 0 to 3~ 65535), the touch panel will show all parts in the window. In the meantime, if the window has a bottom window and all parts in the bottom window will be displayed also. All the touchable parts (such as bit state setting, function keys and so on) defined in the bottom window are also valid in the current window. The common window is also displayed with all parts of it valid if it has been invoked by taskbar button.

The maxim number of windows in a project is 65535 (including all three types of windows). A project can only have one fast selection window, however, the function key **Change Fast Selection Window** can be used to switch over to another window and assign that one to be the current fast selection window. For details, please refer to Section 6.29, "Function Key".

After creating a new blank project, it has a default start window. Normally this window is numbered "0" (to change the number, please change it in the **HMI Properties** dialog box in the project edit window). In general, a project contains multiple windows. The valid window number ranges from 0 to 65535.

By default, Window 1 and Window 2 are the common window and fast selection window of a project respectively. To change the default fast selection window and common window, double click the HMI to modify the **Touch Screen Extended Properties**, as shown in the following figure:

Print Setting Se HMI		erial Port O Setting Task Bar		Serial Port 1 Settin HMI Extend Attribution			
ScreenProtect	10		Public Win.Attrib	oution	Display bel	ow the basic v	vindov
TextLab Lan.	4	•	Pop Window Att	ribution	Display on	the top layer	
Default Lan.	1	•	Upload Key	888888		🔲 Save Ev	ent Log
🔲 Init.Macro		Ŧ	0 Level Key	888888		Init.Addr.	0
Init.Window	Frame0	•	1 Level Key	888888		RecordNO	0
Public Window	Frame1	•	2 Level Key	888888		🗌 Use Buz	zer
Fast-sel.Win.	Frame2	•				Cursor	Color

∕∆_{Note:}

- 1. A maximum of 16 pop-up windows can be opened at the same time.
- 2. A window can only be opened once.
- 3. The function key Close Window cannot close direct or indirect windows, since the opening or closing of a direct window is only related to the ON or OFF state of the bit address that controls its switch, and the opening or closing of an indirect window is only related to the data content of the word address of the indirect window. The function key Close Window cannot change the values of these bit (word) addresses, so it cannot close these windows.
- 4. All pop-up windows are attached to the current basic window, so when the basic window closes (or switches to other basic window), the attached pop-up windows will be closed either. In this case, if you switch the window to the basic window previously opened again, you may find that the original pop-up windows attached to this basic window still exist (unless you run related command to close them).
- 5. The basic window must be of the full-screen size.
- 6. The fast selection window supports pop-up windows, but the "Truncated" feature of the pop-up windows invoked by fast selection window can not be selected when setting the property of that pop-up window.
- 7. Pop-up windows are attached to the windows which contain the parts that invoke those pop-ups. So pop-up windows invoked by parts in the common window will exist until the common window parts turn them off.

4.2 Window Properties

To set the window properties, double click on the blank area of the window or click the *show the window properties setting dialog box.*

Window Attribution	Σ
Window	
Na Frame0	No. 0 Safe Level Lowe -
🔲 Special Attribute	Print page 👻 🔲 Disable Map Keyboard

Bottom Window-	
1 None	▼ 2 None ▼ 3 None ▼
Frame Width 0	Frame Color Pop Window Type Image: Tracking Monopoly Image: Clipping Coherence
	OK

The descriptions of the window properties are as follows:

Name: A unique name allocated to each window for the convenience of differentiation and remembering. The name here can be changed whenever it is necessary to do so.

Number: The valid window number ranges from 0 to 65535. The window number is automatically allocated by the system when a window is created. The user cannot change it. The window numbers may not be consecutive due to the deleting/adding operations.

Position: If a window is a window that appears by use of the function key in **Pop-up Window**, the position of the point at the upper left corner of the window will be displayed here. The position of the origin of the screen is (0,0) and the origin point is the upper left corner of the screen.

Width/Height: A pop-up window supports the setting of width and height (smaller than the size of the screen, of course). However, a basic window should be set to the default size (that is, the full-screen size).

Print Page: Indicate whether the window is used as the print window. For more information about printing, refer to chapter 10.

Video Page: Indicate whether to set the window as a video window. (Only the MT5600T and MT5700T have the video function)

Use Background Fill Effect: To fill the background of window with the patterns or colors, check this option.

Fill Color and Background Color: Select according to the fill style used (for the description of the fill effect toolbar, please refer to Chapter 3). The selected fill color is the impression color, and the background color is the fill pattern color. Fill style 0 is used by default, that is, a pure color. In this case, only the fill color is displayed.

Pop-up Window Type: Track, Monopoly, Truncate and Coherence.

These parameter types indicate the relationship between a pop-up window and its adjacent window. If a window has the property of "Monopoly", before the window appears, its father window

will be frozen, and furthermore, the pop-up window will be displayed in the topmost layer all the time. If a window has the property of "Truncate", the frame of the window is restricted by its father window, that is to say, the part displayed outside the frame of its father window will be truncated. If a window has the property of "Track", the window will track the movement of its father window.

Note: If "Truncate" is selected, "Track" must be selected either.

Window A and Window B in the following are attached to the base window. Normally, if you touch Window A, it will be displayed in the topmost layer. However, if the property of **[Coherence]** is selected for Window A, even if you touch Window A, it will not appear in the topmost layer. Instead, it clings to its father window all the time.

Note: After a window is created, its number cannot be changed, but the name, frame and background color can be changed whenever it is necessary.

	Window A	
	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,	
Window		
l		

Security Level: Used to set the security level for a window. For details, refer to Chapter 12, **"Security Level"**.

Bottom-layer Window: Used to set the bottom window for the current window. A window to be assigned as a bottom window must be an existing one. In general, components shared by multiple windows can be placed here.

Frame: The frame is recommended to use for a pop-up window. For the frame width, select any number among 0 through 16. If the frame width is not "0", select other color for the frame.

There are two ways for changing the window properties:

- 1. Double click the blank area in the window.
- 2. Do not select any component in the window. Click the Select on the toolbar.

4.3 Creating a Window

Click in the [Window Toolbar] to create a new window.

4.4 Opening a Window

After a window is created, make selection in the dropdown menu in the **Window Toolbar**, all existing windows can be selected from the list. You may also click the *icon* to display the previous window. Click the *icon* to display the next window. If you use a mouse with a wheel, you can directly roll the wheel to change the window number.

4.5 Deleting a Window

As shown in the above figure, in the **Project Construct Window**, select a window to be deleted, and press the **[Delete]** key in your keypad. In this case, an alert box appears. Select **[Yes]** to delete the window, all the components in the window will also be deleted. Be careful when using this function.

EV5000	X
Confirm to delete window Fr	ame4?
Yes No	

Note: The deletion of base windows (Frames 0, 1, 2 and 3) are forbidden. Once they are deleted, the project should not be downloaded into panel, or the panel will not operate normally.

4.6 Examples for Windows

Several basic examples will be given below to explain some basic operations about "window".

◆ **Example 1**: We often need to write a special value into some registers as soon as a project starts running or an application window is opened, to conduct initialization. For example, when Frame0 starts up, LB0 is set to "ON", and LW1 is set to "200".

1. Create a bit setting part, with the Address Type set to LB, Address to "0", and the Type to Set to ON at window open.

Bit	Setting C	отрог	en	t Attril	oution									×

5. The finished project window is shown as follows:

6. Save, compile and perform online simulation of the project: LB0 is set to ON, and LW1 is set to 200.

Reference for this example: Section 6.1, "Indicator Lamp", Section 6.2, "Bit Setting Component", Section 6.4, "Multi-State Setting" and Section 6.11, "Numeric Display" in Chapter 6.

Example 2: It is an example of pop-up keypad window for number entry. In many cases, we need to conduct write operation for registers. If the keypad is fixed on the current window, it will occupy too much screen area, so that the current window design space of the project is greatly reduced. In this example, we use the direct pop-up window method to solve this problem. Assume that LW0 is the register need an input operation.

Note: The EV5000 software has a keypad in Window 3, which can be directly invoked, so you do not have to create a keypad by yourself each time. To create your own keypad, please refer to chapter 6.

Create a new project or open an existing one. Enter the window editing mode. Create a numeric input component, with the Address Type set to LW, Address to "0", Address Type in the Trigger Address tab set to "LB", and Address in the Trigger Address tab set to "9000". (by default)

The entire project is shown as follows:

Save, compile, and make offline simulation of the project:

4. Click **Number Input part**. Upon LW0 input, a keypad appears below the component for you to input. After the input, the keypad automatically disappears, as shown in the following figure:

4.7 Window-related Components

Function keys directly related to windows include: Change Basic Window, Return to Previous Window, Change Common Window, Pop-up Window and Change Fast Selection Window. Components directly related to windows include: Direct windows and indirect windows. For the contents of these components, refer to related contents in Chapter 6, "Components".

Chapter 5 Design with EV5000, Some Basic Knowledge

5.1 Parts

Generally, a window contains many parts of different kinds, such as switches, lamps, numeric input parts and shape parts. Parts are divided into two species: PLC parts and Function Parts. They can be found in the Graphic element Window. Following a three-step procedure, the user can add a part to the window.

▶ Process of adding a PLC part

- 1. Click to select then drag a part icon from the PLC component toolbox to the window editing area.
- 2. After dropping the icon, the **Component Attribution** dialog box of the part appears. Set the properties of the part in this dialog box. Attributions most frequently used are PLC input/output address, vectogram or bitmap, label, position, and so on.

Bit Setting Component Attribution											X		
Basic Attri	bution	Bi	t State	e Setti	ng T	ag	Gra	phi cs	Pos	sition			
Priority	Normal		r

WordNo.	1	Ŧ	🗖 Use	e Addr T	ag J	Word	۱o.	1	Ŧ	🔲 Use	Addr 1	ag	
Description	SBO												
												OK	

 After setting the various properties of the part close the dialog box, users can see the part appears in the window. Users can drag the icon to adjust the size and position of the part. For precise adjustment, open the part Component Attribution dialog box and input the value of size and position in the "Position" tab.

The procedure of adding a function part is similar with that of the PLC part,

5.2 About Part ID

 ID is a number automatically allocated to a part. It is used to differentiate parts on the screen. The designer cannot manually designate or change the component ID.
 The ID has two parts: a combination of two or three letters indicates the full name or function of that part and a number used as a symbol to distinguish the part from its homogeneous. All the letter combinations and their meanings are listed below:

BL: Indicator lampWL: Word Lamp (Multi-State Display)SB: Bit setting componentSWD: Word settingSW: Switch

- MSW: Multi-state switch
- FK: Function key
- **MV: Moving Parts**
- ANI: Animation
- NI: Numeric Input
- ND: Numeric Display
- TI: Text Input
- TD: Text Display
- BR: Bar graph
- SC: Scale
- IDW: Indirect Window
- DW: Direct Window
- AD: Alarm Display
- TR: Trend Curve
- RCP: Recipe data transmission
- ED: Event Display
- TM: Timer
- OS: Oscilloscope
- SCR: Scroll bar
- BG: Bitmap graph
- VG: Vector graph
- XY: XY Plot
- MT: Meter
- AB: Alarm Bar
- NP: Note Pad

5.3 Additional Note (Description)

If necessary, each component can be added with a note. This note only plays the function as a descriptive remark for the current program, and can serve as future reference, which facilitates in the understanding of print results. This note does not have any substantial influence upon the program.

sie Attri Priority	Normal				-				sition

escription	SB1										

5.4 Input/Output Address of PLC

Parts related to PLC registers during runtime must be designated with proper PLC I/O address to ensure the program run correctly. The correct address type and range are different for different PLCs. As shown in the following figure, PLC0 is a MODBUS device, while PLC1 is a SIEMENS product, so their addresses are different. The program will automatically list the correct address type and range according to the PLC type.

Description SW0										
								确定	取消	

Туре	Device Name	Range	Description
Bit	LB	0~9999	The register is in the local memory
Bit	RBI	0.0~261000.15	Index address of the recipe memory , in X.Y format,
Bit	RB	0.0~261000.15	h=0 \sim F, absolute address of the recipe memory
Word	LW	0~10256	Address of the Local memory
Word	RWI	0~261000	Index address of the recipe memory
Word	RW	0~261000	Absolute address of the recipe memory

An internal node can also be selected as input origin or output target. The descriptions of the internal nodes are as follows:

RB and **RW** point to the same area, for example, **RB5.0**~**RB5.F** and **RW5** map into the same word of the recipe memory, **RB5.0** is **Bit0** of **RW5**. However, **LB** and **LW** map into different areas, and their addresses in the memory are different.

LB9000~LB9999 in LB and LW9000~LW10256 in LW are reserved for system functions, which have special usage, so the user cannot use them like common nodes. Therefore, the user should use their special functions according to related instructions. For details, please refer to Chapter 11. If an index address accesses the recipe memory, the index address itself serves as the base address, the offset address is stored in the register LW9000, the physical address is the sum of the base address and the offset. For example, if (LW9000)= 50, the index address RWI 100 will access the data of the addresses of RW 150 (100+50). (For details, refer to Chapter 8, "Recipe Data".)

5.5 Vector graph

Shapes and images are organized in libraries in ev5000 software. There are two kinds of image: Vector Graph and Bitmap. Library of vector graph is named as *.vg file and bitmap laibrary is named as *.bg file. The user can create vector graph with the drawing tools in ev5000 drawing toolbar. Vector graphes are suitable for simple shapes like buttons, lamps, and pipes and so on. Each *.vg or *.bg file has up to 32 states and 32 different appearance, so the user can use one single graph to represent a multi-state variable or part. *.vg and *.bg files are stored in the **Shape Library** in the **Project File Window**, as shown in the following figure:

Some shape library files are installed into the ev5000 folder with the program files, the user can import these pre-made shape into their own projects. Click the **Import Shape Library** icon on the toolbar, and the following dialog box appears:

Then, find the LIB/vg file under the software installation directory, the .vg files are classified into different categories stored in corresponding folders for easy browsing. Select a vectogram to be imported, click **Import**, the vectogram will be copied to the vg folder under the current project directory. It supports the simultaneous import of multiple vectograms or bitmaps. For shapes in the same folder, you only need to select all shapes to be imported, and click **Import**. All the vectograms and bitmaps imported or created for the entire project will be displayed in the **Shape**

Library in the Project File Window, so that the user can view and use the shapes conveniently.

A vectogram may include 32 states, and it can be use in two modes: static vectogram without changing states or indicator of a multi-state part.

▶ Procedure of creating a new vector graph

1. Select **New Graphics** in the **Library** Menu, or click the *icon* on the toolbar, the following dialog box appears.

Image: Address Tag(B) Image: Adarm Information LogOn(A) Image: Event Information LogOn(E) Image: PLC Control(P) Image: New Graphics(G) Image: Image: Image: Place Control Con	Address Tag(B) Image: Address Tag(B)	Libra	ary(<u>D)</u> Window(<u>W</u>) Help(<u>H</u>) Text Labrary(T)

Туре	🔿 Bitmap	Width	100
	• Vector Graphics	Height	100
File Nam	e:\text\text_01\	vg	
Descript	ion		
	ОК	Cancel	□ .

2. Name the vector graph, select "Vector Graphics" and enter the number of state that vector graphic has. The size of the graphic and the filename can be designated here, too. For better understanding, the user can add a description to the graphic as a note. In this example, it is named as "Lamp" with two states. Click **Create**, and the following editing window appears:

The user can add more states to the vector graphics after creating them. The procedure is decribed here:

Double click the *.vg you want to add states to to enter the drawing window, Click the icon end to add a new state to the current vg. A vg can have up to 32 different states.

3. Click to select a state, the state being selected is outlined by a green frame. By default, the latest added state is set to be selected after being added. Draw lines, rectangles and other shapes with the tools in the drawing toolbar to edit the appearance for the selected state. After finishing drawing for all states, click save and close the drawing window.

🔲 Use Bitmap		
*		
Import Graphics		
	Graphics State 0	•
	OB	

6. Close this dialog box, and the component will be displayed in the screen in the mode of a vectogram.

• •			, vv	LŲ		
			•		•	
				-		

All loaded *.vg files will be listed in the **Project File Window**, under the directory of **Shape** Library.

To modify any vectogram or bitmap, find the shape to be modified in the **(Project File Window)**, double click to enter the edit window of the shape, and you may modify the shape in this window. The above line shows the various states of the vg or bg file, and the area below the states window is the appearance editing area for the state being selected.

∕∆_{Note:}

- 1. After creating and editing a vg shape, click save before close the editing window, or you will lose all the changes you've just made.
- 2. No text can be added to a vectogram.

5.6 Bitmap Graphics

Like vector graphic, a bitmap graphic can also have up to 32 states and represent different states of a multi-state part with a single graphic. The most significant difference between bitmap and vector graphic is that the user can import external images of various formats (*.bmp, *.jpg and *.gif) into the project and converted them to *.bg files. The basic operations of a .bg file are quite similar to those of a .vg file, with a few differences.

Note: Such operations as drawing a line and drawing are forbidden in a bitmap. Only external shapes can be added.

The procedure of creating and editing a .bg file is shown below:

1. Select **New Graphics** in the **Library** menu or click the *icon* on the toolbar, the following dialog box appears:

New Gra	phics			
Name	pic	State	1	*
Туре	🖲 Bitmap	Width	100	
	C Vector Graphics	Height	100	
File Nam	e e:\text\text_01\	vg		
Descript	ion			
	OK	Cancel		.::

2. Select **Bitmap** for **Type**, enter the number of states and name of the bg, click **Create**.

						1///	///.	10
×	Γ							
		s	tate	:O				
	<				1111			
	<]				 		
	<)						
	<							
=	<		•	· · ·		 		

The user can add additional states to an existing .bg file. The procedure is decribed as follows: Double click the bg file you want to add state to in the Projcet File Window. After entering the editing mode, click the editing area below the states preview window, the icon for adding new states will be activated. Click the icon, a new state will appear after the current last state in the states preview window. The latest added state will be selected and ready for editing.

3. Click the **k** icon in the **Drawing Toolbar**, find the image you want to import, click to open it. For bitmap graphics, you can only import a picture, other editing operations such as line drawing tools and other similar tools are disabled, as shown in the following figures:

.∟ [•]		_
	Open ? 🔀 Look in: 📳 My Pictures 💽 🗢 🖻 📸 •	
	Kinco ###* defaultlog Sample Pictures	_
	File name: Open Files of type: Graphics File(*.bmp; *.gif; *.jpg) Cancel	

4. Click **Save** and close the bitmap editing window, you can use it in the configuration window through the bitmap component.

Use of bitmaps:

1. Select a component you want it to use a bitmap, open the component attribution dialog box and switch to the Shape tab:

Bitmap Component Attribute	X
Graphics Position	
Use Vector Graphics	
	Kinco 步科电气
qq.bg 🔹	
Use Picture Init. Size Import Graphics]
	Graphics State 🛛 🔽
	OK Cancel

2. Select the **(Use Bitmap)** option. Select the bg file to be used, the preview of the bg is shown on the right. Click **(OK)** to close the dialog box.

Import Existing Bitmap Graphics:

1. You may import a bg file like the import of a vg file. Click the *icon* icon to show the importing dialogbox. Select **Bitmap** for the **Import Type**. You can import *.bg files used in other projects (they are stored in the "vg" folder under the directory of the project folder.) or *.bg files provided by us. (visit our website to download the bg file package,)

2. The *.bg files and *.vg files of the same project are stored in the "vg" folder under the project folder directory. The *.bg file is converted from other images; the original images are stored in the "image" folder under the project folder directory. Please do not delete the images in that folder, or the corresponding *.bg files will not be used any more.

A Note:

The original image is stored in the "image" folder when being imported, so the image must have a unique file name to avoid confliction. If such confliction occurs when editing a new .bg file, the newer image will not be added to the "image" folder, so the two bg file, including the previous and the new one, will be linked to the same original image and they may look the same.

The size and color quality of images in the bitmap library determine the size of the target file, and also affect the configuration execution speed. Please pay attention to the following points when a bitmap library is created:

- i. The maximum size for original image being imported is the physical resolution of the panel. Any image exceeds this size cannot be imported. In this case, the image should be cut into the proper size before being imported. It is strongly recommended to resize the original image to the same size of the part using that image. Doing so will greatly save storage space and ensure the fast run of the panel. For example, the user want to import an image for a part of the size 100×60, but the size of the original image is 200×120, Since the image size doesn't exceed the smallest panel resolution 320×240, the image can be imported and used for that part, but it will be displayed as a 100×60 part, which means the a original image of the size 100×60 will have the same effect. Resize the larger original image will certainly save 3/4 storage space and small file will save the time for the panel CPU. Always take your time to resize the image to proper size will make the project file smaller and run faster.
- ii. Images are stored in lossless compression mode in the panel, so any image of the loss

compression format (for example ,jpg) will be converted to lossless compression file, which may make the file larger than original image. The actual size of an image depends mainly on the number of pixels. For example, for a 100×60 color picture, its size before compression is 100×60×2 (=12000 bytes), and the compression rate in lossless compression mode is 10~80%, depending on the specific images. Therefore, to reduce the project size, reasonable optimization of the image size and colors is the best way.

iii. When importing a bitmap, if there is no special requirement, try to make the outer frame of the bitmap fit the outline of the edit box; otherwise, a blank area will appear in the bitmap. Suppose the user import a 100×50 original image to a edit box of the size 100×100, the user should stretch the image after importing to make it fill the edit box. When using the bitmap graphic in configuration window, you can stretch the outline of the part or enter the size in the "Position" tab of the component attribution dialogbox, In these two method, you can retrim the bitmap to its correct ratio. (image needed)

5.7 Creating a Label

A label refers to a text displayed on the surface of switches, lamps or other components.

Adding a label

- 1. Select Label tab in the Component Attribution Dialogbox of the part selected.
- 2. Check the option **Use Label**.
- 3. As shown in the following figure, fill the content to be displayed on the label in **Content**.

- 4. Set such display properties as alignment mode, font size and color.
- 5. Click **OK** to finish the setting.

State No.: The **State No.** is only valid for components with multiple states. The text of each state can be displayed independently. The user can set the text content, font size, color and the alignment for corresponding states separately.

Content: Enter the text to be displayed on the surface of the component. If there are multiple

lines, press the [Enter] key to start a new line.

Font Size: The variable font size range is: 8, 16, 24, 32, 48, 64, 72 and 96 pixels.

Alignment: If the text input of a label exceeds two lines, Left, Right or Center can be selected for the alignment of the multiple lines.

Color: The user can select from a palette of 40 frequently-used colors among 65536 colors.

The **Primary Color** palette includes the most frequently used colors. The **Custom** palette allows the user to customize a palette (there are 65536 optional colors).

5.8 Taskbar and Task Buttons

The eView5000 provides a simple method for window actions such as pop up or minimize, change the display or quickly switchover between windows. All these can be done with taskbar. The taskbar provides two task buttons, one is used to control the Fast Selection window, and the other is used to control the taskbar itself.

In the **HMI Attribution** dialogbox in the project window (double click the HMI icon or right click and select "Attribution" to open it), the user can set the taskbar, including whether to use the Fast Selection window, color, position, and other related properties. (By default, all the items in the taskbar are selected)

If Include Fast Selection Window (labled as "Include F-S Window") is selected, click the Fast

Selection window button in the left, a Fast Selection window appears. This window provides some function keys (placed by the user) for switching to different windows. Since the Fast Selection window is always displayed in all screens, it can be invoked anytime. To switch to a specific window, touch the function key pointing to the destination window, in this way the process of monotonous window search can be avoided.

The taskbar can include a maximum of 16 window icons at the same time. Double click the **Minimize** icon, and the related pop-up window will be minimized; clicking this icon again will retrieve the minimized window to original state. Pop-up window with the function keys **Minimize Window** and **Window Bar** can be minimized to the taskbar. Refer to the description in the **Components** and **Function keys** part in Chapter 6.

Procedure of setting task buttons

In the project window, double click HMI to show the HMI Attribution setting dialog box. Open the Taskbar tab, check the **Display Taskbar** option. The user can set the position of the task buttons: to the right or to the left. The label content of the taskbuttons can be changed in the corresponding edit box. Background color and alignment of the text can be set in the dialogbox also. If the labels of the two task buttons can not be fully displayed, try to adjust the button area size and the font size of the text.

Print Setting	Se	rial Port	t O Sett	ing	Ser	iall	Port 1	l Settir	ıg	
HMI		Task Bar			HMI Exte	end /	Attrib	oution

🔽 IncludeAlarmLamp	A	Alarm Lamp Color 🔻				^	Task	Bar	^	
Include F-S Win.	T-C	Lamp Fran	ne Color •]		~			~	
	Ţ-C u	in-Workspa	ace Colo r	<	>		<	>		
	T-C	Workspac	e Color 🔻		Color	•		Color	•	
ButtonAreaSize:Width	140	Height	32	Font	24	•	Font	24	-	

Note: During operation, the Fast Selection window is displayed in the left or right of the screen. In the edit window state, the Fast Selection window is an independent window. Window 2 serves as the Fast Selection window by default. For detailed descriptions of the taskbar, please refer to Section 7.2.

Chapter 6 Components(Parts)

Components(Parts) are designed to meet specific requirements. In general, a component is designed to implement one function. However, some components have to be used with other components and objects or a PLC to implement specific functions, as shown in the table below:

Component	Related Component/Object	Description					
Numeric input	Function key	Keypad created by "Function key"					
Text input	Function key	Keypad created by "Function key"					
Indirect window	Window	"Indirect window" part must point to an existing window					
Direct window	Window	"Direct window" part must point to an existing window					
Alarm	Alarm display	Alarm information displayed on the screen or the					
information	Alarm banner	banner must be entered in the system by using					
logon		the "alarm information logon" function					
		Alarm information displayed on the screen or the					
Alarm display	Alarm information logon	banner must be entered in the system by using					
		the "alarm information logon" function					
		Alarm information displayed on the screen or the					
Alarm banner	Alarm information logon	banner must be entered in the system by using					
		the "alarm information logon" function					
Event		Event information must be entered by using the					
information	Event display	"Event information logon" tool before it can be					
logon		displayed.					
		Event information must be entered by using the					
Event display	Event information logon	"Event information logon" tool before it can be					
		displayed.					
PLC control	PLC	Function defined by "PLC control" part is invoked					
		or controlled by PLC registers					

Most components support "bit" or "word" addresses (such components as numeric input and scroll bar can perform double word operation). Since some PLCs have "double word" address, so the drivers of these PLCs will convert between "double word" address used in the PLC and "word" address used in the panel. The user has to pay special attention to the operation instructions for PLC drivers.

6.1 Indicator Lamp

An indicator lamp displays the ON or OFF status of a designated PLC bit address. If the bit status is OFF, the shape representing state 0 will be displayed. If the bit status is ON, the shape representing state 1 will be displayed. The corresponding label will also be displayed if "Use Label" is enabled. The figure below shows the appearance of an indicator lamp component.

Adding an indicator lamp

1. Click the **Indicator Lamp** icon and drag it to the configuration edit window, the component attribution dialogbox shows, the fist tab is the **Basic Attribution**:

Øi	Vit State Lamp Component Attribute											
E	Basic Attribute Bit State Lamp Tag Graphics Position											
	Priority	Normal		v								
	- Input Addre	ess				Output	t Add	ress		_		
	нмі	HMIO	•	PLC	0 -	нмі		HMIO	-	PLC	0 ,	-

	Code Type	BIN	-	Format	DDDDD	Code T	уре	BIN	*			
	WordNo.	1	Ŧ	🗆 Us	e Addr Tag	WordN	0.	1	Ŧ	🗖 Use/	Addr Tag	J
	Description											
										ОК	Cano	el

- Priority: Reserved function, not used for the time being.
- Input Address: Bit address of the PLC register that controls the lamp state, shape and label information.

HMI: If your project contains more than one HMI panel, select which HMI panel the lamp part belongs to in this field.

[PLC]: Select a PLC. If this HMI is connected with more than one PLC, select the PLC containing the expected register.

Address Type: Select the address type corresponding to the lamp, that is, the address type of the register being monitored. The address type varies with PLC type. Besides the

PLC registers, you can also use the bit registers within the HMI panel. For internal register address of HMI, refer to Section 5.4. Please note that some internal addresses of the HMI are reserved by the system. Do not use these system-reserved addresses. For details, refer to Chapter 11.

Address: Bit address corresponding to the lamp.

Use Address Label: Whether to use the address entered in the address label. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the lamp.

2. Go to the **Lamp** tab:

Bit State Lam	p Component Attribute			
Basic Attribute	Bit State Lamp Tag Graphics Position			
Function	Normal Normal value 1 Blinking on state 0 value 1 Blinking on state 1 value 1 switch Blinking on state 0 or 1 value 0 Blinking on state 0 value 0 Blinking on state 1 value 0 switch Blinking on state 0 or 1	Rate	0	*100ms
	[OK		Cancel

> Function:

Normal: Just display state graphic in static state.

Blinking on state 0: The lamp will Blink the shape corresponding to state "0" when the bit status is OFF. The blinking period is set in the **Rate** text box. When the bit satus is ON, the lamp will show the state 1 shape in static state.

Blinking on state 1: The lamp will Blink the shape corresponding to state "1" when the bit status is ON. The blinking period is set in the **Rate** text box. When the bit satus is ON, the lamp will show the state 0 shape in static state.

3. Go to the Label tab: Fill in text to denote OFF or ON state. :

Bit	State	Lamp Compo	nent Attribute			X
E	lasic Attri	ibute Bit State	Lamp Tag Grap	hics Position		
	🗸 Use	Tag Language	English(USA 🔻	🔲 Use Text Lib	rary 123	Ŧ

		OK	Cancel

- 5. Go to the **Position** tab, adjust the position and size of the lamp if necessary.
- 6. Click the OK key to complete the setting of the lamp component.

6.2 Bit Setting Component

The bit setting component defines a touch area, which sets a specified bit to a certain status, ON or OFF, when it is touched or activated by other conditions.

Adding a bit setting component

1. Click the bit setting component icon and drag it to the window, the Component Attribution dialogbox appears. The first tab is the **Basic Attribution** tab.

asic Attributi	on Bit	Stal	e Setting	µ Tag	Gr	aphics Posi	tion				
Priority	Normal		Ŧ

Word	1	Ŧ	📕 Us	e Addr 1	ag	WordNo.	1	Ŧ	📕 Usev	Addr Taj	9
Description	SBO										

Output Address: Bit address of the PLC register whose ON or OFF state is controlled by the bit setting component. The "HMI" field, "PLC field" and "Address type" field is similar with those of the Indicator lamp component.

Address: Bit address of the register corresponding to the bit setting component.

Use Address Tag: Whether to use the address stored in the **address tag library**. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the bit setting component.

2. Go to the Bit State Setting tab:

Bit State	Setting Component Attribute
Basic Attr	ibute Bit State Setting Tag Graphics Position Set On when Window Open C On Off Toggle Reset Set On when Window Open Set Off when Window Open Set Off when Window Close Set Off when Window Close Set Off when Window Maximized Set Off when Window Maximized
	OK Cancel

Several modes of the function of the bit setting component are listed here, as the following table decribes.

Type and Functions of Bit Setting Components

Туре	Description
ON	When the bit setting component is touched, the corresponding PLC bit
	register is turned ON. The state will be kept (i.e. remains ON) even after
	release.
OFF	When the bit setting component is touched, the corresponding PLC bit
	register is turned OFF. The state will be kept (i.e. remains OFF) even after
	release.
Toggle	Every time the bit setting component is pressed, the corresponding PLC bit
	register filp its current status once (ON \rightarrow OFF, OFF \rightarrow ON) (Toggles).
Reset	Only while the bit setting component is held down (pressed) will the
	corresponding PLC bit register be turned ON. Likewise, when the switch is
	released, the specified bit register is turned OFF.
Set ON at	When the window containing this bit setting component is opened, the
window open	corresponding PLC bit register is turned ON.
Set OFF at	When the window containing this bit setting component is opened, the
window open	corresponding PLC bit register is turned OFF.
Set ON at	When the window containing this bit setting component is closed, the
window close	corresponding PLC bit register is turned ON. This operation is only
	applicable for local bit (LB or LW.x).
Set OFF at	When the window containing this bit setting component is closed, the
window close	corresponding PLC bit register is turned OFF. This operation is only
	applicable for local bit (LB or LW.x).
Set ON at	When the window containing this bit setting component is maximized, the
window Max.	corresponding PLC bit register is turned ON.
Set OFF at	When the window containing this bit setting component is maximized, the
window Max.	corresponding PLC bit register is turned OFF.
Set ON at	When the window containing this bit setting component is minimized, the
window Min.	corresponding PLC bit register s is turned ON.
Set OFF at	When the window containing this bit setting component is minimized, the
window Min.	corresponding PLC bit register is turned OFF.
Set ON while	When the window containing this bit setting component is being displayed and
back light OFF	the back light is OFF, the corresponding PLC bit register is turned ON.
Set OFF while	When the window containing this bit setting component is being displayed and
back light OFF	the back light is OFF, the corresponding PLC bit register is turned OFF.
Set ON at	When a numeric input component has conducted a successful input operation
successful input	in the window containing this bit setting component, the corresponding PLC
	bit register is turned ON.
Set OFF at	When a numeric input component has conducted a successful input operation
successful input	in the window containing this bit setting component, the corresponding PLC
	bit register is turned OFF.

- 3. Go to the Tag tab: Fill in text to denote states.
- 4. Go to the **Graphics** tab: Select a vectogram or bitmap to indicate the touch area and touch status (whether this component is pressed or not).
- 5. Go to the **Position** tab: and adjust the position and size of the bit setting component if necessary.
- 5. Click **OK** to complete the setting of the bit setting component.

6.3 Switch

The switch is a combination of Indicator Lamp and Bit Setting components. It indicates the ON/OFF status of a PLC bit register, and defines a touch area, when activated, it may change

the status of a designated bit register. The input address and the output address can be the same or different.

Adding a switch component

1. Click the switch icon and drag it to the window, the **Basic Attribution** tab of the **Component Attribution** dialogbox appears.

Bit	Bit Control Component Attribution											×
Ē	Basic Attribution Switch Tag Graphics Position											
	Priority Normal *											
Input Address Output Address												
	нмі	HMIO	•	PLC	0 -	нмі	HMIO	•	PLC	0	•

	Code Type	BIN	Ŧ	Forma	at:DDDDD	Code Type	BIN	Ŧ	Format	DDDDD		
	Word	1	Ŧ	📕 Us	e Addr Tag	WordNo.	1	Ŧ	📕 Usel	Addr Ta	9	
	Description	SWO)			~					_	
											ОК	ī
										_		_

Priority: Reserved function, not used now.

- Input Address: Bit address of the PLC register that controls the switch state, shape and label information.
- Output Address: Bit address of the PLC register whose ON or OFF state is controlled by the switch.

Address: Input/output address of the register corresponding to the switch.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the switch component

2. Go to the **Switch** tab and set switch types:

Bit Control Component Attribution	×
Basic Attribution Switch Tag Graphics Position Switch Type On On Off Toggle Reset	
	ОК

Switch Types and Functions

Туре	Description
ON	When the component is pressed (touched on the panel), the corresponding
	PLC bit register is turned ON. The state will be kept (i.e. remains ON) even
	after being released.
OFF	When the component is pressed (touched on the panel), the corresponding
	PLC bit register is turned OFF. The state will be kept (i.e. remains OFF)
	even after being released.
Toggle	Every time the component is pressed, the corresponding PLC bit register
	flips its current state once (ON \rightarrow OFF, OFF \rightarrow ON)
Reset	Only while the component is held down (pressed), is the specified PLC bit
	register turned ON. Likewise, when the switch is released, the specified bit
	register is turned OFF.

- 3. Go to the **Tag** tab: Fill in text to denote states.
- 4. Go to the **Graphics** tab: Select a vectogram or bitmap to indicate the bit register states and represent the touch area.
- 5. Go to the **Position** tab, and adjust the position and size of the switch component if necessary.
- 6. Click **OK** key to complete the setting of the switch component.

6.4 Word Setting

The word setting component is also a

touch area that when activated writes a word to the designated PLC word register.

Adding a word setting component

 Click the word setting component icon in the PLC parts window and drag it to the configuration edit window, the Basic Attributions tab of the Component Attribution dialogbox appears.

Word Setting Component Attribution										
Basic Attributi	on Multi-Si	tate Settin	ng Tag	0	Graphics Po	sition				
Priority	Normal	Ŧ								
- Input Addre	ess			_	Output Add	dress —				
нмі	HMIO 💌	PLC	0	Ŧ	нмі	HMIO	• P	LC	0	•

Word	Ŧ	📕 Use	e Addr Tag		WordNo.	1	- [Use,	Addr Tag	,
Description	SWD0			_						
										ЭК

Output Address: Address of the PLC word register controlled by the word setting component.

Address Type: The type of the word register, the prefix for word address varies with PLC type.

Address: The address of the PLC word register corresponding to the word setting component.

Code Type: BIN or BCD.

No. of Words: Select 1 or 2 for word output address (single word or double word).

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the word setting component.

2. Go to the Multi-State Setting tab and select the setting modes for word setting component:

Word Setting	Component Attribution	X
Basic Attribution	n Multi-State Setting Tag Graphics Position	1
SettingMode Dec value	Sub value Set at Window Open Set at Window Close Set at Window Maximized Set at Window Minimized Set at Window Minimized Set at Enter Success Set at Enter Fail Add value Sub value	
		ОК

Setting Mode: As shown in the following table:

Туре	Description
Set Constant	When the component is pressed (touched), preset constant data will be written to the designated PLC word register. (the constant is set in the " Set Value " box.)
Set at window open	To initialize the designated Word Register with a constant value at the time of window open. This operation is only applicable for LW (local word) . (Enter the constant in the " Set Value " box.)
Set at window close	To set designated word register with a constant value at the time of window close. This operation is only applicable for LW (local word). (Enter the constant in the "Set Value" box.)
Set at window Max.	To initialize the designated PLC Word register at the time window is maximized. (Enter the constant in the " Set Value " box.)
Set at window Min	To initialize the designated PLC Word register at the time window is minimized. (Enter the constant in the " Set Value " box.)
Set at back light OFF	Set when the back light is turned OFF (Enter the constant in the " Set Value " box).
input	Set when the numeric or text component conduct a successful input operation (Enter the constant in the " Set Value " box).
Set at input failure	Set when the numeric or text component conduct a unsuccessful input operation (Enter the constant in the " Set Value " box).
JOG+	Every time the component is pressed, the incremental value is added to the

	current value of the designated PLC word address, if the result is not larger than upper limit. The incremental value is set in the "Inc. Value" field
JOG-	Every time the component is pressed, the decreased value is subtracted from the current value of the designated PLC word address, if the result is
	not less than lower limit.
JOG++	When the component is pressed and held for a time longer than Delay
	Time, the incremental value is added to the current value of the designated
	PLC word address in every interval of Execution Speed. The increased
	amount is the Incremental Value.
JOG	When the component is pressed and held held for a time longer than Delay
	Time, the decreased value is added to the current value of the designated
	PLC word address in every interval of Execution Speed. The decreased
	amount is the Decreased Value .

- 3. Go to the **Graphics** tab: Select vectogram or bitmap to indicate the corresponding address states and represent the touch area.
- 4. Go to the Label tab: Fill in text to denote states.
- 5. Go to the **Position** tab, adjust the position and size of the word setting component if necessary.
- 6. Click **OK** button to complete the setting of the word setting component.

6.5 Multi-State Display

A multi-state display component changes its appearance according to the value of related PLC word address. If the value of the word register is 0, the graphic corresponding to state 0 will be displayed. If the value equals to 1, the shape corresponding to state 1 will be displayed, and so on. The corresponding label will also be displayed if the option **Use Tag** is enabled.

► Adding a multi-state display component

 Click the multi-state display component icon and drag it to the edit window, the Basic Attribution tab of the Component Attribution dialogbox appears.

Word Display Component Attribution								×	
Basic Attributio	on Mu	lti-SI	tate Disp	lay Tag	Graphics Po	osition

Description	WLO	1			· ·				
								0	IK

Priority: Reserved function, not used for the time being.

Input Address: PLC word register address that controls the state, shape and label information of the multi-state display component.

Address: The address of the word registers corresponding to the multi-state display component. The usage of register address varies with different PLCs; refer to PLC manual for detailed information.

Code Type: BIN or BCD.

No. of Words: Select 1 or 2 for input address (single word or double word).

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the multi-state display component.

2. Go to the **Multi-State Display** tab and set the number of states for multi-state display component. The user can set a maximum of 32 states.

Word Display Component Attribution	
Basic Attribution Multi-State Display Tag Graphics Po	sition
State Num. 2	
Data Mapping State No. Map Value	
0 0	
1 1	
	OK

Data mapping: Every state of the multi-state display component is linked to a unique value of the designated PLC word register. When the register value equals to one of the Map Values in the mapping list, the multi-state display component will display the corresponding state. The mapping detail is listed in the **data mapping** list, the user can view and edit the mapping relationship between state number and register value.

- 3. Go to the Tag tab: Fill in text to denote different states (or leave it empty).
- 4. Go to the Graphic tab: select a vectogram or bitmap to display the state graphic of the multi-state display component.
- 5. Go to the **Position** tab, adjust the position and size of the multi-state display component if necessary.
- 6. Click the **OK** button to complete the setting of the multi-state display component.

Note on Data Format Types

BIN (binary format)

15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

BCD (binary coded decimal format)

15 14 13 12	11 10 9	8	7	6	5	4	3	2	1	0
10 ³	10 ²			1	0 ¹			1	0 ⁰	
thousand	hundre	ed	•	ter	1		or	ne		

For example:

10010100 (BIN data) = $1*2^{7}+0*2^{6}+0*2^{5}+1*2^{4}+0*2^{3}+1*2^{2}+0*2^{1}+0*2^{0}$ (decimal data) = 128+16+4 = 148

1001 0100 (BCD data) = 9_{10}^{1} + 4_{10}^{0} (decimal data) = 94 (1001 (binary) = 9 (decimal), 0100 (binary) = 4 (decimal))

6.6 Multi-State Switch

The Multiple State Switch is a combination of multi-state display component and

multi-state setting component. It displays different states (a maximum of 32 states) depending on the value of the PLC word address. It also defines a touch area that,

when activated, writes a specified data to the PLC word register. The input address can be the same as the output address or different from it.

► Adding a Multi-State Switch

1. Click the multi-state switch icon and drag it to the window, the **Basic Attribution** tab of the **Component Attribution** dialogbox appears.

Priority	Normal	lormal 👻

Word	1	•	📕 Use	e Addr Tag	WordNo.	1	•	🔲 Use /	Addr T ag	
Description	MSV	/0								

Priority: Reserved function, not used for the time being.

- Input Address: PLC register address that controls the state, shape and label information of the multi-state switch.
- > **Output Address**: Address of the PLC register controlled by the multi-state switch.

Address: The address of the word register corresponding to the multi-state switch. The address type must be properly set, refer to PLC manual for detailed information.

Code Type: BIN or BCD.

No. of Words: Select 1 or 2 for single word and double word., respectively

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the multi-state switch.

2. Go to the **Multi-State Switch** tab and set the number of states and dada mapping list for the multi-state switch component. The user can set a maximum of 32 states.

Word Control	Component Attribut	ion		
Basic Attribution	Multi-State Switch Ta	ag Graphics Position	1	
Control Mode	Add		State Num. 2	•
Data Mapping	State No. M 0 0 1 1	ap Value		
				OK

Functions of Multi-State Switch Setting mode:

Туре	Description
JOG+	When the Multi-State Switch is pressed, the value in the designated output
	address register is increased by one. If the result equals to one map value in
	the mapping list, the corresponding state will be displayed.
JOG-	When the Multi-State Switch is pressed, the value in the designated output
	address register is decreased by one. If the result equals to one map value in
	the mapping list, the corresponding state will be displayed.

Data mapping: Every state of the multi-state display component is linked to a unique value of the designated PLC word register. When the register value equals to one of the Map Values in the mapping list, the multi-state display component will display the corresponding state. Since the multiple state switch component can write and read the register, when the switch is set to a new state, the corresponding map value will be written to the designated word register. The mapping detail is listed in the **data mapping** list, the user can view and edit the mapping relationship between state numbers and register values

- 3. Go to the Label tab: Fill in text to denote states.
- 4. Go to the **Shape** tab: Click the vectogram or bitmap to display the register states and represent the touch area.
- 5. Go to the **Position** tab, and adjust the position and size of the multi-state switch component if necessary.
- 6. Click **OK** to complete the setting of the multi-state switch component.

6.7 XY Plot

XY Plot XY plot is a curve which shows the relationship between two variables in a vivid way. Two neighbouring word registers form a pair. The lower register contains the value representing the X axis while the higher one corresponds to the Y axis. Such a pair of registers represents a sampling point. A curve consists multiple smapling points must use the same number of register pairs.

For example : Suppose an XY plot component containing M channels, each chanel contains N sampling points on each page. For this XY plot on one page, the required registers in PLC cover a continous area of $M \times N \times 2$ words, as shown below:

 $X_{11},\,Y_{11},\,X_{12},\,Y_{12},\,\ldots\,X_{1N},Y_{1N},\,\ldots,\,\ldots,\,X_{M1},\,Y_{M1},\ldots,\,X_{MN},\,Y_{MN}$

Note: For X_{ij} and Y_{ij} , the subscript i indicates channel number and j indicates sampling point. X_{ij} indicates the horizontal axis value of the sampling point j in the channel i.

► Adding an XY plot component

 Click the XY plot icon and drag it to the window, the Basic Attribution tab of the Component Attribution dialogbox appears.

Description	XY0									

Priority: Reserved function, not used for the time being.

Input Address: PLC word register address corresponding to the designated X axis track data, the word address corresponding to Y axis is input address + 1; If there are more than one channel, the corresponding address of the second channel is: X axis: input address + 2×number of sampling points; Y axis: input address + 2×number of sampling points

Address: The address of the word register corresponding to the XY plot.

Code Type: BIN or BCD.

No. of Words: Depend on the number of channels, number of sampling points, and current address type of **XY** plot. It is calculated by system, not settable by the user.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the XY graph component.

2. Go to the XY Graphics tab and set related parameters.

Y Graph (Compone	nt Attr	ibute				le l

🗖 Time	HMIC 👻	0 -	LW	- 0	BIN	∗ 12	👻 🥅 Use Addr. Tag
							OK Cancel

Type: Single page or multiple pages.

If the user selects the single page mode, it will only display the data change of the sampling points in the current page. Points out of that page will not be saved or displayed. If the user selects multiple-page display mode, each channel of the XY graph can save: number of pages × number of sampling points. In this way, when the XY graph rolls forward, the previous sampling data will not be lost. Historical data will be saved to the memory for future reference. Please note that a maximum of 31 pages of historical data are available, which is determined by the **No. of pages** parameter.

Attribute: Start from left or Start from right. In other words, it determines whether the graph is displayed from the left to right or from the right to left when displaying sampling data.

Sampling Time: Time interval between two pages of sampling points, in seconds.

No. of Sampling Points: Number of sampling points displayed on the graph.

No. of Pages: When the Type is set to "Multiple Pages", this box is available.

Channel: Number of tracks to be displayed, corresponding to the number of word registers. Two word registers correspond to one track.

Hold(Keep): The bit address that controls the start or stop of the XY graph; in other words, the sampling data stops when the [**Hold**] bit is turned ON, and the sampling continues and XY graph will be dynamically displayed when the [**Hold**] bit is turned OFF again.

Scroll: This address has to cooperate with the scrolling bar, that is, the user can view the XY graph by directly moving the scroll bar. Set the scrolling address the same as the address of the scrolling bar component to be associated. For details, refer to Section 6.27 "Scroll Bar".

Time: When the **Save Time** check box is selected, the **Time** box in the lower part of the window will be available. It includes 12 words used to save the time of the latest sampling point. The 12 words contain the "second, minute, hour, day, month, year" of the start point and the "second, minute, hour, day, month, year" of the end point in the current page. Each word

represents a time point.

3. Go to the **Channel** tab and set related parameters of each track.

x	/ Grap	h Com	ponent Attri	ibution					×
ſ	Basic Att	tribution	XY Graphics	Channel	Position				
	No.	Lin	Data type	YZero	Y Span	XZero	XSpan	Color	Ε
	0	1	signed int	0	5	0	5		
									_
-								ОК	=

Color: Designate the color of each track.

Line Width: The width of a line, including 8 options.

Data Type: Sets the data type, with only two options of signed integer and unsigned integer.

Data type		
signed int	-	
signed int	*	
unsigned in	v	

Max. and Min Value in X Direction: Set the corresponding maximum and minimum values of each track line along the Y direction. When a read value from the corresponding register is greater than the maximum value or less than the minimum value, the maximum value or the minimum value will be displayed on the graph.

Max. and Min Value in X Direction: Set the corresponding maximum and minimum values of each track line along the X direction. When a read value from the corresponding register is greater than the maximum value or less than the minimum value, the maximum value or the minimum value will be displayed on the graph.

- 4. Go to the **Position** tab, and adjust the position and size of the XY graph component if necessary.
- 5. Click **OK** to complete the setting of the XY plot component.

6.8 Moving Component

window at a location specified by the PLC register. The state and the absolute location of

the shape on the window depend on current reading value of three continuous PLC registers. Typically, the first register controls the state of the component. The Second register controls the horizontal position (X), and the third register controls the vertical position (Y).

► Adding a moving component

1. Click the moving component icon and drag it to the window, the **Basic Attribution** tab of the **Component Attribution** dialogbox appears.

Type and Function Table:

Up to 32 different states can be assigned to the components in EV5000 software. When the component has only one state, the value of the register specified by the Read Address ("input address" in the "Basic Attribution" tab) must be held 0, otherwise the component may not be displayed. The state numbers 1 ~32 correspond to internal register values 0~31 respectively. The position is controlled as shown in the table below. Position is relative to the original location of shape. (X axis indicates the horizontal axis and Y axis indicates the vertical axis).

Control Mode	X	Y	X & Y
Length of Read Data	2 words	2 words	3 words
Lowest word	Component State	Component State	Component State
	(an integer between	(an integer between	(an integer between
	0 and 31)	0 and 31)	0 and 31)
2 nd word (Read	X displacement	Y displacement	X displacement
Address + 1)			
3 rd word (Read	N/A	N/A	Y displacement
Address + 2)			

Moving modes are as follows:

	position.
V Doverse Seeling	The function is the same as the X scaling, but at an opposite
X Reverse Scaling	direction.
V Doverse Seeling	The function is the same as the Y scaling, but at an opposite
Y Reverse Scaling	direction.

When **scaling** is used, scaling is performed as follows:

Display value = Current position + <u>(Reading value – Input Min.)</u> × (Scaling max. – Scaling Min.) (Input Max. – Input Min.)

When **reverse scaling** is used, scaling is performed as follows:

Display value = Current position + <u>(Input Max. – reading value.)</u> × (Scaling max. – Scaling Min.) (Input Max. – Input Min.)

3. Go to the Label tab: Fill in text to be displayed.

4. Go to the Graphics tab: Select vectogram or bitmap to represent motion or to display states.

5. Go to the **Position** tab, and adjust the position and size of the moving component if necessary.

6. Click OK to complete the setting of the moving component.

6.9 Animation

The Animation Component is used to place an object on the window at a specified location determined by a predefined path and data in the PLC. The state and the absolute location of the shape on the window depend on current reading value of two continuous PLC registers. Typically, the first register controls the state of the object, and the second controls the position along the predefined path. As the PLC position register changes value the vectogram or bitmap jumps to the next position along the path.

- ► Adding an Animation component
- 1. Click the **Animation** icon.
- 2. Click on screen to define the path and the moving nodes for the object to travel, click on each moving node one by one to set the path, and then right click to complete the setup of path.
- 3. Double click on the animation component, and the following dialog box appears. Fill in the **Basic Attribution** tab.

Priority	Normal		Ŧ							
Input Addre					Cutput Ad	dress —				
нмі	HMIO	•	PLC	0 🔻	НМІ	HMIO	Ŧ	PLC	0	Ŧ
Addr.Type	LW	•	Addr.	0	Addr.Type	LW	Ŧ	Addr.	0	
Code Type	BIN	•	Format	DDDDD	Code Type	BIN	Ŧ	Format:	DDDDD	
Word	2	Ŧ	📕 Use	e Addr Tag	WordNo.		Ŧ	📕 Use/	Addr Tag	
Description	ANIO				~ ~ <u></u>					

Priority: Reserved function, not used for the time being.

Input Address (Read Address): The word address that controls state and label of the Animation component in the PLC. **Read Address + 1** is the word register address that controls the position of the Animation component. Data in the register may be interpreted as BIN or BCD format (refer to Multi-State Display component). The **No. of Words** is restricted to 2.

Address: The lower word register address corresponding to the animation component.

Code Type: BIN or BCD.

No. of Words: It is restricted to 2 for input address.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the animation component. 4. Go to the **Animation** tab:

Animation Component Attribution							
Basic Attribution Animati	on Tag Graphics						
Moving Node List							
No.	X-Axis	Y-Axis	Add Node				
0	186 247	178 299	Insert Node				
2 3	402 309	197 179	Delete Node				
			Shift Up				
			Shift Down				
Size£ ^g Width 32	Height 32	State Num.	4				
			ОК				

No. of States: Select the total number of states for the animation component. This determines the number of states of vectograms or bitmaps that will be displayed along the predetermined path.

Add Node: Add a new moving node to the end of the current predetermined path.

Insert Node: Insert a new moving node after the moving node being selected.

Delete Node: Delete the selected moving node

Shift Up: move the selected node to the position before the previous one.

shift Down: move the selected node to the position after the next one.

Size of Graphics: the size of the graphic representing the moving object.

Node 0 (1, 2, 3...): Select a designated track node. Point 0 is the start node, point 1 is the second node, and so on. The total number of moving nodes depends on the number of moving nodes placed on the screen when. X(Y) corresponds to the coordinate position of the moving nodes, where you can edit the coordinate position of each node.

- 5. Go to the Tag tab: If you want to use tags for different state, check "Use Tag" and Fill in text to be displayed.
- 6. Go to the Graphics tab: Select a vectogram or bitmap to represent moving objects, the selected graphic must have more states than the number of state of the animation component.
- 7. Click OK to complete the setting.

Read Data Assignment:

Read Address	Object state
Read Address + 1	Position number on the path

◆ The following is an example showing how to use the animation component.

6.9.1 Adding an animation component

The settings are as follows:

Read data: LW1 (BIN format), state control

LW2 (BIN format), position control

No. of states: 4

Number of positions : 4

6.9.2 Presetting the screen track nodes

6.10 Number Input

The Number Input component displays the current value of a PLC register

data and can pop-up a small keypad for the user to change the register data. If the **Trigger Address** bit is ON, once the number input component area is touched, the Numeric Input component will be activated for data entry. Use the keypad to enter data to the PLC register designated by **Input Address**. It is a frequently used part for monitoring and changing PLC register data.

Adding a Numeric Input

1. Click the numeric input component icon and drag it to the window, the Basic Attribution tab of the component attributions dialogbox appears.

Pata Input Component Attribution									
Basic Attribution Numeric Data Trigger Address Font Graphics Position									
Priority Normal -									
- Input Addre	ess				Output Ad	dress —			h
НМІ	HMIO	•	PLC	0 -	нмі	HMI0 -	PLC	• • 0

Code Type	BIN	•	Forma	tDDDDD	Code Type	BIN	Forma	tDDDDD	
Word	1	•	📕 Us	e Addr Tag	WordNo.		r 🗖 Use	Addr Tag	
Description	NIO								
								OK	

Priority: Reserved function, not used for the time being.

Input Address: The starting address of PLC word register to be displayed and modified by numeric input component. Data in the register may be interpreted as BIN or BCD format (refer to Multi-State Display component). The No. of words is restricted to 1 (16 bits) or 2 (32 bits). Address: The PLC word register address corresponding to the numeric input component. **Code Type**: BIN or BCD.

No. of Words: Select 1 or 2 for input address.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the numeric input component.

2. Go to the Numeric Data tab:

Data Input Component Attribution								
Basic Attribution	Numeric Data T	rigger	Address Font	Graphics Position				
Data Type	signed int	•						
Digits Above Dec	cimal-Point	4	•					
Digits Below Dec	simal-Point	0	-					
Min. Value	0		Max. Value	9999				
🥅 Project Data	Conversion							
Pro.Min Value	0		Pro.Max Value	9999				
					ОК			

Data Type: Control the input format of data, including "Signed integer", "Unsigned integer", "Hex", "Binary", "Mask", "Single float", and "Double float". For details, refer to "Numeric

Display Format" later in this section.

Numeric Setting: Set the position of the decimal point, number of digits, max. value, and min. value.

Project Data conversion (Engineering data conversion): Applicable only to two data types of "Signed integer" and 'Unsigned integer".

3. Go to the Trigger Address tab: Enter the trigger bit address, which enables the numeric input component. Only when the trigger bit address is ON will the numeric input operations be valid. Since LB9000 ~ 9009 are internal reserved addresses initialized to be ON after startup, the component uses LB9000 as the default trigger address. (For details about system reserved registers, see chapter 11)

Data Input C	Component Att	ribution	×
Basic Attribut	ion Numeric Data	a Trigger Address Font Graphics Position	
нмі	HMI0 💌		
PLC No.	0 -		
Addr. Type	LB 🔹		
Address	9000		
Format:DDD	DD		
			01
			OK

4. Go to the Font tab: Set the size, color, and alignment mode of display numeric digits.

Data Input	Compon	ent Attr	ibutio	n					X
Basic Attrib	ution Num	neric Data	Trigge	r Address	Font G	raphics Po	sition		
Font Size	16	·	Align	Right			Color	•	
Example	****						[OK	

Font Size: Set font size, including such options as 8, 16, 24, 32, 48, 64, 72 and 96.

Align: Applicable only to decimal format, that is, two data types of "Signed integer" and "Unsigned integer". For example, set "integer digit" = 5, "decimal digit" = 0, and enter the number 123. The display format covers:

Align right	123	
Left	123	
Leading zero	00123	

5. Go to the Graphics tab: Select vectogram or bitmap to enhance display effect. The graphic selected here can be used as the background of the digits.

Data Input Component Attribution		×
Basic Attribution Numeric Data Trigger Address Font	Graphics Position	
Use Vector Graphics		
NUB_CTRL_BAR001.vg		
🗖 Use Bitmap		
-		
Import Graphics		
	Graphics State 0 -	
	OK	

• Click **OK** to complete the setting and place the numeric input component in an appropriate position.

Numeric Display Format:

(1) Signed integer and unsigned integer: Data displayed in decimal format (0~9). Only when these two option is selected will the Engineering data conversion function enabled:

The reading value is displayed in its original value and mark decimal point in the position specified by the "Digits below decimal point". For example, if the "Digits below decimal point" = 2, a reading value "14561" is displayed as 145.61.

Engineering Data Conversion: The reading value is converted to its engineering unit before display. Scaling is performed as follows:

Conversion value = Engineering Min. +

(Reading value – Input Min.) * (Engineering Max. – Engineering Min.) (Input Max. – Input Min.)

The conversion value will be displayed according to the setting of "digits above decimal point" and "digits below decimal point". For example if conversion value is 123.456 and the digits below decimal point = 2, digits above decimal point = 3, then the conversion value is displayed as "123.45", the last digit is truncated.

(2) Hex: The number is displayed in hex (0~F) format, scaling and decimal point are disabled.

FFFF					
	Data Input Com	ponent Attri	bution		
	Basic Attribution	Numeric Data	Trigger Address Font	Graphics Position	
	Data Type	hex	•		
	Digits Above De	cimal-Point	4 -		
	Digits Below De	cimal-Point	0 *		
	Min. Value	0	Max. Value	65535	
	F Project Data	Conversion			
	Pro.Min Value	0	Pro.Max Value	9999	
					OK

(3) Binary: The number is displayed in binary (0~1) format, scaling and decimal point are disabled.

nponent Attribu	11011		
Numeric Data Tri	igger Address Font	Graphics Position	
bin	•		
ecimal-Point	4 -		
ecimal-Point	• 0		
0	Max. Value	65535	
a Conversion			
	bin ecimal-Point ecimal-Point	bin ecimal-Point 0 Max. Value	bin ecimal-Point 0 Max. Value 65535

In case of Hex and binary formats, the maximum and minimum input values are regarded as unsigned binary data.

(4) **Password:** Display only "****" for any reading value. This is used for password input, scaling and decimal point are disabled.

Data Input Com	ponent Attributi	on		X
Basic Attribution	Numeric Data Trig	ger Address Font	Graphics Position	
Data Type	password	·		
Digits Above De	ecimal-Point 8	•		
Digits Below De	cimal-Point 0	Ψ.		
Min. Value	0	Max. Value	99999999999	
F Project Data	a Conversion			
Pro.Min Value	0	Pro.Max Value	9999	
				OK

(5) Single float: Data from the controller register is translated from a 32-bit IEEE Floating-Point format to a decimal number and displayed.

(6) **Double float:** Data from the controller is translated from a 64-bit IEEE Floating-Point format to a decimal number and displayed.

When input data, the Input Min. and Input Max. limit the range of valid input data, and Engineering Max. and Engineering Min. limit the range of valid input data if "**Project (Engineering) Data Conversion**" is selected.

If "Project (Engineering) Data Conversion" is selected,

the value written to the PLC = (Input data – Engineering Min.)×(Input Max. – Input Min.)

(Engineering Max. – Engineering Min.)

+ Input Min.

Single Float format (32 bits)

S	e[30:23]	f[22:0]
3	30	22
1	23	0

Single Float Bit Pattern	Value
0< e < 255	(-1) ^S x 2 ^{e-127} x 1.f
e=0 ; f != 0	(-1) ^s x 2 ⁻¹²⁶ x 0.f
e=0; f=0	(-1) ^S x 0.0
s=0, e=255, f=0	Positive infinity
s=1; e=255; f=0	Negative infinity
s=0 or 1; e=255; f!=0	Invalid number

Double Float format (64 bits)

S	e[62:52]	f[51:32]
6	62	51
3	52	32

	f[31:0]	
31		
0		

Double Float Bit Pattern	Value
0< e < 2047	(-1) ^s x 2 ^{e-1023} x 1.f
e=0 ; f != 0	(-1) ^S x 2 ⁻¹⁰²² x 0.f
e=0; f=0	(-1) ^S x 0.0
s=0, e=2047, f=0	Positive infinity
s=1; e=2047; f=0	Negative infinity
s=0 or 1; e=2047; f!=0	Invalid number

The above format is in accord with IEEE standard 754, and the arithmetic model is specified by the IEEE standard for Binary Floating Arithmetic.

6.11 Numeric Display

1234

designated PLC register data. No vectogram or bitmap can be associated with this component.

Adding a Numeric Display component

1. Click the numeric display component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Priority	Normal		Ψ.

4. Click OK to complete the setting and place the numeric display component in an appropriate position.

6.12 Text Input

A Text Input display current value of the PLC register data as decoded by the standard ASCII character table. If the [**Trigger Address**] is active (turned ON), when the shape area is touched, text input will be available through an keypad. Entered data is put into consecutive PLC registers starting with the [**Input Address**]. The ASCII code stored in the lower byte is displayed on the left and the one stored in the higher byte is displayed on the right.

Touch the shape area to activate		AAA	AAAA D	AAA					
the text input		A	В	C	D	Е	F	G	Н
		Ι	J	K	L	М	N	0	Р
		Q	R	S	Т	U	V	W	X
	Enter data from keypad	Y	Z	В	S	ES			ΙT

► Adding a Text Input Component

1. Click the text input component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Text Input C	ompon	en	t Attrib	oution								×
Basic Attributi	on Trig	ger	Address	Font	Gra	phics Posit	ion

Some users would like to display the contents on the keypad when entering data. To implement this function, a text input component can be placed in the keypad to read the corresponding data between LW9060 and LW9075.

♦ An example of the usage for LW9060 ~ LW9075 is shown as follows:

1. Create a new project and add a text input component on window 0. Set the parameters as shown in the figures below, notice that the input component has 5 words for storage, so the user can input up to 10 characters.

The project wizard has a default numeric keyboard on window 3 for numeric value input. On Window 1, which is the default common window, there are two direct widnow components. They will popup window 3 when there is a touch event on numeric/text input component. To use a customized keyboard other than the default window 3, please delete the two direct window components. If you want all the numeric/text input components to use the same keyboard, put the direct window component on Common window 1 and make the DW part call the customized keyboard window. If you want the input components on different windows to have their own keyboard, put DW part on the window where the input component is.

The two DW parts on window 1. They will pop up default window 3 when an input component is pressed. Delete them if you want to use customized keyboard.

2. Compute the size of the keyboard. In this example, we will create a keyboard with 10 digit keys, all 26 letter keys and four function keys: Clear, Backspace, Esc and Enter. The keyboard has four lines with 10 keys on each line. We set the size of one key to be 25×25 , the size of the whole keyboard is 250×100 . For displaying the content just input, add a line 250 pixels wide and 25 pixels high. So the complete keyboard is 250 pixels wide and 125 pixels high. In this example, we use window 4 as the keyboard window. Use the window attribution dialogbox to change the size of the window to 250×100 .

Add function keys on window 4 and designate the ASCII code for the key. In the following figure, we put a function key and configure it for inputting "a" (for details about function key, refer to section 6.?)

Go to the **[Tag]** tab, set the tag for the key as "a". Go to **[Graphics]** tab and select a graphic for the key. Go to the **[Position]** tab, set the size of the key to 25×25 :

Function Key Trigger Addr Tag Graphics Position Left

Add a text display component, according to the above description of the register LW9060-LW0975, if the font alignment mode for the text display component is set to **Align Right**, the data starts from the highest word, that is, LW9075. Since the text input component covers 5 words, the input address of the text display component is LW9071. (LW9071 to LW9075 are used for saving the content the user has just input,) Goto the Font tab and set the alignment mode as "**Align Right**"

1 F011	FK <mark>A/AtA //</mark> 2 3 4 Text Display C	56	78	90

4. Save the project and compile it, Perform the off line simulation. The effect of the project is shown in the following figure:

6.13 Text Display

A Text Display component displays the current value of the PLC register data. The data is decoded by standard ASCII character table. The ASCII code stored in the lower byte is displayed on the left and the one stored in the higher byte is displayed on the right.

Adding a Text Display

1. Click the text display component icon and drag it to the window, the basic attribution tab of the component attributions dialogbox appears.

Text Display	Comp	one	ent Attr	ibution						(×
Basic Attributi	on For	ıt	1								
Priority	Normal		Ŧ								
- Input Addre	ess				Output Add	dress —					
нмі	HMIO	•	PLC	0 -	нмі	HMIO	Ŧ	PLC	0	-	
Addr.Type	LW	•	Addr.	0	Addr.Type	LW	Ŧ	Addr.	0		
Code Type	BIN	•	Forma	tDDDDD	Code Type	BIN	Ŧ	Format	:DDDDD		
Word	1	•	📕 Us	e Addr Tag	WordNo.		Ŧ	🗖 Use	Addr Tag		
Description	TDO										
										_	
										ЭК	

Priority: Reserved function, not used for the time being.

Input Address: The address of the PLC word registers to be displayed (a maximum of 16 words with each word containing two ASCII characters).

Address: The initial address of the word registers corresponding to the text display component.

Code Type: BIN or BCD.

No. of Words: 1 ~ 16 optional for input address.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the text display component.

2. Go to the **Font** tab: Set the size, color, and alignment mode of display texts.

Text Displa	ıy Co	mponent	Attributio	on			X
Basic Attrib	ution	Font					
Font Size	16	•	Align	Left	•	Color	
Example	AA						
							IK

3. Click OK to complete the setting and place the text display component in an appropriate position.

6.14 Bar Graph

The Bar Graph displays the PLC register data as a bar graph in proportion to its value as defined by the maximum value and minimum value settings.

As shown in the figures below, the user can customize bar graphs of any shapes.

Adding a Bar Graph

1. Click the bar graph component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Bar (Graph Co	ompon	en	t Attrib	ution					×
Bas	sic Attributio	on Bar	Gra	aphics (Graphics Po	sition				
P	riority	Normal		Ŧ						
الے ا	nput Addre	22				Output Add	dress			h
н	IMI	HMIO	•	PLC	0 -	нмі	HMI0 ·	PLC	0 -	
А	ddr.Type	LW	•	Addr.	0	Addr. Type	LW -	Addr.	0	
С	ode Type	BIN	•	Forma	tDDDDD	Code Type	BIN	Format	DDDDD	
W	Vord	1	Ŧ	📕 Us	e Addr Tag	WordNo.		- 🗖 Use	Addr Tag	
De	escription	BRO								
									OK	

Priority: Reserved function, not used for the time being.

Input Address: The initial address of the word address corresponding to the bar graph. **Code Type**: BIN or BCD.

No. of Words: Restricted to 1 or 3. Set to 1 when the variable alarm is disabled. Set to 3 when the variable alarm is selected. For 3 words condition, the Bar Graph component will receive three continuous data words, one for data and two for upper and lower alarm limits. **Use Address Tag**: Whether to use the address entered in the address tag library. For details,

refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the bar graph component.

2. Go to the **Bar Graph** tab: Set the parameter as shown in the figure below:

Bar Graph Com	iponent Attr	ibution			×
Basic Attribution	Bar Graphics	Graphics Posit	ion		
Direction	Up 🔽	🔲 Variable A	Alarm	Bar Normal Color	•
Min. Value	0	Low Alarm	0	Alarm Color	•
Max. Value	1	High Alarm	1	Frame Color	•
				Background	•
				ОК	

Direction: Up, Down, Left and Right, indicating the direction of the bar movement. **Variable Alarm**: If this check box is selected, the upper and lower alarm limits will be obtained from the PLC register described later in this section, and the values for such limits are changeable. If this check box is not selected, the upper and lower alarm limits depend on the values set in the **Upper Alarm Limit** and **Lower Alarm Limit** text boxes in the figure. If the value of the **Input Address** is between the upper and lower limits, the bar graph will not generate an alarm; otherwise, it will generate an alarm. The color will vary with the settings of the **Alarm Color**. Thus the user can use different colors for normal data and data exceed alarm limits.

Variable Alarm	Checked	Unchecked
Read Address	Bar graph data	Bar graph data
Read Address +1	Lower alarm limit	
Read Address +2	Upper alarm limit	

Maximum Value/Minimum Value: Set the corresponding maximum value and minimum value for the bar graph.

Upper Alarm Limit/Lower Alarm Limit: If the **Variable Alarm** check box is not selected, these two text boxes are valid. Under this condition, the panel use the two panel registers instead of two PLC registers to store the alarm limits.

Color: Set bar color (for normal value), bar color (for values exceed alarm limits), background color and frame color.

3. Go to the Graphics tab: Select vectogram or bitmap to enhance display effect.

4. Click OK and adjust the position and size of the bar graph component.

6.15 Meter

The Meter displays PLC register data as an angular indicator in proportion to its value as defined by the maximum value and minimum value setting.

A traditional meter may be composed of three parts

Procedure to add a Meter

1. Click the meter component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

M	eter Compo	onent /	\tti	ribution	ı						×
Γ	Basic Attributi	on Met	er C	Componer	nt Position						
	Priority	Normal		Ŧ							
	- Input Addre			_		Output Add	dress —				
	нмі	HMIO	•	PLC	0 •	нмі	HMIO	Ŧ	PLC	0 -	
	Addr.Type	LW	•	Addr.	0	Addr.Type	LW	Ŧ	Addr.	0	
	Code Type	BIN	•	Format	:DDDDD	Code Type	BIN	Ŧ	Format:	DDDDD	
	Word	1	•	📕 Use	e Addr Tag	WordNo.		Ŧ	📕 Use A	Addr Tag	
	Description	мто									
										OK	

Priority: Reserved function, not used for the time being.

HMI: If your project contains two or more HMIs, select which HMI it belongs to in this list. In

this way, you can directly operate the local address or the address of the connected PLC of any HMI in the same project.

Input Address: The PLC word register address of the value displayed by the component. **[PLC]**: Select a PLC. If this HMI is connected with more than one PLC, select the PLC corresponding to the input address.

Address Type: Select the address type corresponding to the meter, that is, the monitored address type. The address type varies with PLC type. Alternatively, you can also use the internal address type of the HMI panel. For internal address types of HMI, refer to Section 5.4. Please note that some internal addresses of the HMI are used by the system. Do not use these addresses. For details, refer to Chapter 11.

Address: The initial address of the word registers corresponding to the meter.

Code Type: BIN or BCD.

No. of Words: Select 1 or 2 for input address.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the meter component.

2. Go to the Meter Component tab:

Meter Compone	ent Attribution			
Basic Attribution	Meter Component	Position		
Dial Style	Pie	•	Indicator Color 👻	
Indicator Style	Line	-		
Max 1	Min 0			
				OK

Dial Style: Round (Pointer up, pointer down), sector(Pie)

Max. Value/Min. Value: Set the maximum value and minimum value to be displayed by the meter component.

Pointer: Line shape or diamond shape.

The following figure shows the effect of the meter with a line pointer and a diamond pointer (working with dial component):

Pointer Color: Select the color of the pointer.

Dial style: Sector, round (Pointer up), round (Pointer down)

The following figure shows three types of dials (scale component must be used with meter):

Note: In general, a point has to work with the scale component. The scale can be used to strengthen the operation effect of the pointer. Refer to the description of scale later in this document.

3. Click OK and adjust the position and size of the meter component.

6.16 Indirect Window

The Indirect Window component pops up a registered window over the current screen. Refer to section 4.3 for the creation of a new window. Usually the size of windows invoked by an indirect window component is made smaller than full screen size (or equal to the full screen size). The Indirect Window component calls up a window that is specified by a word register spefified by the **Input Address**. There is no absolute limitation to the maximum registered Indirect Windows components in the EV5000. However, at run time, only 16 windows at the most can be displayed simultaneously. To close an indirect window, change the value of the **Input Address** register to 0.

► Adding an Indirect Window

1. Click the indirect window component icon and drag it to the window, the Basic Attribution tab of the component attribution dialogbox appears.

Priority	Normal		v.						
Input Addre	ess				Output Ad	dress —			
НМІ	HMIO	•	PLC	0 -	нмі	HMIO	Ŧ	PLC	• •
Addr.Type	LW	•	Addr.	0	Addr. Type	LW	Ŧ	Addr.	0
Code Type	BIN	•	Forma	tDDDDD	Code Type	BIN	Ŧ	Format	:DDDDD
Word	1	Ŧ	🗖 Us	e Addr Tag	WordNo.		Ŧ	🗖 Use	Addr Tag
escription	IDW	n					_		

Priority: Reserved function, not used for the time being.

Input Address: The address of PLC word register designated to store direct window No. When the register value changes, the window designated by the changed value will pop up. For example, if the value changes to 20, window 20 will appear (the window must a created window). If the value changes to 0, the window closes.

Address: The word register address corresponding to the indirect window.

Code Type: BIN or BCD.

No. of Words: The default value is 1 for input address.

Use Address Label: Whether to use the address entered in the address label. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the indirect window component.

2. Click OK and adjust the position and size of the indirect window component.

The size of the Indirect Window limits the area of pop-up window. The area of pop-up window out of the Indirect Window boundary will be truncated. The Function Key can be assigned to the window to enable repositioning and minimizing features. (Refer to **Window Bar** and **Minimize Window** in the Function Key Component Section.)

Pop-up method for direct and indirect window: The window is controlled by a PLC bit (Direct Window) or word (Indirect Window) address. Once the bit or word address is activated, the window pops up. When the bit or word changes to 0, the window closes.

Taskbar : If a pop-up window has such function keys as **Window Bar and Minimize Window**), whenever a window is popped up, an icon will appears on taskbar to represent the window. Clicking the window icon on the taskbar will put the corresponding window on the top layer of the screen. Double click the window's icon will minimize the window, and click again will restore the window.

6.17 Direct Window

The **Direct Window** component places a registered window over the current screen. The pop-up window is displayed in the area of Direct Window component outline. Usually the size of Direct Window is set the same as those of pop-up window. There is no absolute limitation for the maximum number of Direct Window. However at run time, up to 16 windows can be displayed simultaneously at a time. A Direct Window can only be open or closed by the bit register specified by the **Reading Address**. The function key cannot be used to close the window. A Direct Window pops up when the bit register is turned ON and the window closes when the bit register is turned OFF.

Adding a Direct Window

1. Click the direct window icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

asic Attributi	on Dire	ect \	Window	Position					
Priority	Normal		-						
- Input Addre	ess				Output Ad	dress —			
НМІ	HMIO	•	PLC	0 -	нмі	HMIO	Ŧ	PLC () *

Code Type	BIN	Ŧ	Forma	tDDDDD	Code Type	BIN	Ŧ	Format:DI	DDDD
Word	1	Ŧ	📕 Use	e Addr Tag	WordNo.	1	Ŧ	🔲 Use Ad	ldr Tag
Description	DW0)							

Priority: Reserved function, not used for the time being.

input Address: Bit in the PLC that activates the direct window.

Address: The bit address corresponding to the direct window component.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the direct window component.

2. Go to the **Direct window** tab and select a target window number in the **Window No.** drop-down list box.

Direct Window Component Attribution
Basic Attribution Direct Window Position Window No. 0: Frame0 1: Frame1 2: Frame2 3: Frame3 4: Frame4
 ОК

3. Click OK and adjust the position and size of the direct window component. The size of the window limits the area of display. The area of pop-up window out of the direct window boundary will not be displayed. Function Key can be assigned to the window to enable repositioning and minimizing features. Refer to (Window Bar)" and (Minimize Window) in the Function Key.

6.18 Alarm Information Logon

Messages to be displayed on the Alarm Display component must be registered in the Alarm Entry list (Alarm information logon). Each message corresponds to a PLC bit register. If the PLC bit device activates (either ON or OFF), the corresponding message is displayed on the Alarm Display. (This component is only used to enter alarm messages. To display alarm messages, the Alarm Display component is required.)

▶ Procedure to add/modify alarm entry message

1. Click the icon (in the database toolbar), the alarm message object library will pop up, or enter the alarm message entry page in the "Library" menu in the menu bar.

No.	Address	Alarm		Content		
Add	Da	elete	Modify			Exit

2. Click the **Add** button to add message or click the **Modify** button to modify an existing message.

No. Addres	Alarm Information		-

	🖵 Use Text Library	→ Text Labrary	
	Font 16	- Text Color -	
	ОК	Cancel	

PLC Address: Designate the PLC bit address to trigger the message.

Attribute:

Alarm-ON: Displays alarm message when bit is ON.

Alarm-OFF: Displays alarm message when bit is OFF.

Content: Enter the message content and color, and the default font size for messages is 16.

3. Click OK and the alarm message will be displayed in the **Alarm List**. After entering alarm message, you can edit existing message through the **Delete** and **Modify** button. Click **Exit** to exit alarm entry.

arm o	bject list			
No.	Address	Alarm	Content	
0	LB:1	On	water	
1	LB:2	On	chack	
Ac	d D	elete Modi	fy	Exit

In order to improve the communication efficiency, it is recommended that a block of continuous PLC bit registsers be used for the alarm list. For example: Use M100~199 to control the display of all messages. In this case, one read command reads M100~199 all at once instead of one bit at a time.

6.19 Alarm Display

The **Alarm Display** component will display all triggered alarm messages in a designated area. The content displayed is the same as that displayed on the alarm bar. All alarm messages are related to specific bit registers. When an alarm message is generated, the alarm will be removed only after the corresponding bit register switches back to normal state; otherwise, the alarm message will always be displayed, that is, the alarm state remains ON. (This component is only used to display alarm message. Messages must be entered with the **Alarm Information Logon** component before display.)

Adding alarm display

1. Click the Alarm Display component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Priority	Normal		*								
Input Addre	ess				h	Output Add	dress —				
нмі	HMIO	•	PLC	0 -		нмі	HMIO	Ŧ	PLC	0	Ŧ
Addr. Type	LW	•	Addr.	0		Addr.Type	LW	Ŧ	Addr.	0	
Code Type	BIN	•	Forma	tDDDDD		Code Type	BIN	Ŧ	Format	DDDDD	
Word	1	Ŧ	🗖 Us	e Addr Tag	J	WordNo.		Ŧ	📕 Use.	Addr Tag	1
Description	ADO										

Priority: Reserved function, not used for the time being.

Input Address: The **Input Address** controls the scrolling (up and down) of the alarm display window. All active alarm messages are sorted by time, the new alarms are displayed on top and the older ones are put on the bottom. If the register value is N, then the top N-1 messages will be ignored and the number N message of the order of arrival is placed on the first line of the display window.

Address: The word address corresponding to the alarm display component.

Code Type: BIN or BCD.

No. of Words: The default value is 1 for input address. Not editable.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the alarm display component.

2. Go to the Alarm Browse tab, as shown in the figure below:

Alarm Display Component Attribution	
Basic Attribution Alarm Display Position	
Row Space	
Column Space 1	
	ОК

Row Spacing/Column Spacing: The spacing between different rows or columns.

3. Click **OK** and adjust the position and size of the alarm display component.

• Example of an Alarm Display

A vectogram (SP_0) is used for the background rectangle. The vectogram SP_1 indicates a sunken display area. Two word setting components (SWD_6, SWD_7) are used to increase and decrease the starting lines of the displayed alarm message (control the increase or decrease of the **Input Address** value). The actual **Alarm Display** component (AL_0) is placed on top of the vectogram. The alarm messages appear in the **Alarm Display** when the system runs. The effect diagram is shown as follows:

6.20 Trend Curve

The **Trend Curve** periodically retrieves a block of PLC data and displays the trend data over time. As each sampling period elapses, the new data is read from the PLC and inserted towards the right side of the trend graph. The trend graph is retrieved on a real time basis.

The newest data is inserted into the left side and the track is shifted right

An example of a typical trend curve is shown as the above. A vectogram is used for the background and scales are added to show relative information about the trend. The trend graph is then placed on top of the vectogram.

Procedure to add trend curve

1. Click the **Trend Curve** component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Tr	end Graph	Comp	оп	ent Att	ribution							X
E	asic Attributio	on Trei	nd (Graphics	Channel F	osition

	Description	TRO				~						
											ОК	

Priority: Reserved function, not used for the time being.

Input Address: Specify the PLC word register of the first trend curve, the second trend curve corresponds to register at **read address + 1**, and the third curve corresponds to register at **read address + 2**, etc

Address: The initial address of the word register corresponding to the trend curve component.

Code Type: BIN or BCD.

No. of Words: Depend on the number of sampling channels. If the number of channels is N $(1 \le N \le 16)$, the No. of words is N.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.34.

Description: A reference name (not displayed) that you assign to the trend curve component.

2. Go to the **Trend Graphics** tab to set related parameters.

Trend Graph Componer	nt Attribute	
Basic Attribute Trend G	raphics Channel Save History Trend Position	
Type Multiple pag 🝷 Attr.	Start from Le 🝷 Sam. Time 1 PageNum. 1	
	Save Time Sam.Plot 10 Channel 1	•
Control Address		
✓ Save Time Sam.Plot 10 Channel 1 -

Roll HMIC - 1 -	- LW - 0 BIN - 3 - □ Use Add	r.Tag
		r Tag
	确定	取消

Type: Single page or multiple pages.

If the user selects the single page display mode, it will only display the data change of the sampling values in the current page. It does not allow the extension of the trend graph. If the user selects multiple-page display, it allows the extension of the trend graph. Data is displayed in the same way, but when the trend graph rolls forward, the previous sampling data will not be lost. Historical data will be saved to the memory for future reference. Please note that a maximum of 31 pages of historical data are available, which is determined by the **No. of pages** parameter.

Attribute: Start from left or start from right. In other words, it determines whether the graph is displayed from the left to right or from the right to left when displaying the sampling data.

Sampling Time: Time interval between two sampling points, in seconds.

No. of Sampling Points: Number of sampling points displayed for one curve.

No. of Pages: When the Type is set to "Multiple Pages", this box is available.

Channel: Number of tracks to be displayed, corresponding to the number of word registers of the PLC data. One word register corresponds to one track.

Hold(Keep): The bit register that controls the start or stop of the trend graph; in other words, the sampling data stops when the [**Hold**] bit is turned ON, and the sampling continues and trend graph will be dynamically displayed when the [**Hold**] bit is turned OFF again.

Scroll: This address has to be used with the scrolling bar component, that is, the user can view the trend graph by directly moving the scroll bar. Set the scrolling address the same as the address of the scrolling bar component to be associated. For details, refer to "Scroll Bar".

Time: When the **Save Time** check box is selected, the **Time** box in the lower part of the window will be activated. It includes 12 words used to save the time of the latest sampling point. The 12 words contain the "second, minute, hour, day, month, year" of the start point and the "second, minute, hour, day, month, year" of the end point in the current page. Each word

represents a time point.

3. Go to the **Channel** tab and set related parameters of each track.

Tr	end G	raph C	omponent /	Attribution			×
B	asic At	tribution	Trend Graphi	ics Channe	Position		1
	No.	Lin	Data type	YZero	Y Span	Color	
	0 1 2 3	1 1 1	signed int signed int signed int signed int	0 0 0	5 5 5 5	Toda -	
							OK

Color: Designate the color of each track.

Line Width: The width of a line, including 8 options.

Data Type: Set the data type, with only two options of signed integer and unsigned integer.

Data type	
signed int	•
signed int	
unsigned in	w.

Max. and Min Value in Y Direction (Y zero and Y span): Set the corresponding maximum and minimum values of each track line along the Y direction.

- 4. Click OK and adjust the position and size of the trend graph component.
- Examples of a single-page trend graph and a multi-page trend graph

6.20.1 Single-page Trend Graph

Firstly, create a project and save it.

Add a single-page trend graph component. In the Basic Attribution tab, set **Input Address** to LW0. In the **Trend Graph** tab, set **Sampling Time** to 1 second, **No. of Sampling Points** to 21, and **Channel** to 4, as shown in the figure below:

Туре	Э	Single	•	A	lttr.	Start	from Le	• Sa	m.Time	1	P	ageNum. ¹	
						🗖 Sa	ve Time	Sar	n.Plot	21		Channel 4	•
- Co	ontrol A	ddress											
		HMI PLC No.		Addr.T	Addr.Type Address CodeType								
	Кеер	HMIC	•	0	•	LB	- 10	0	Forma	tDDDDI)	🔲 Use Addi	Tag
	Roll	HMIC	Ŧ	0	Ŧ	LW	. 0		BIN	* 3	Ŧ	🔲 Use Addi	r.Tag
	Time	HMIC	-	0	-	LW	÷ 0		BIN		-	🔲 Use Addi	Tan

In the **Channel** tab, set the color of four track lines respectively to blue, red, green, and purple. Set the minimum value to 0 and the maximum values respectively to 500, 1000, 1500, and 2000.

asic At	tribution	Trend Graph	ics Channe	el Position		
No.	Lin	Data type	YZero	Y Span	Color	
0 1 2 3	3 3 3	signed int signed int signed int signed int	5 5 5 5	500 1000 1500 2000		

Adjust the size of the trend graph component.

Add two scale components: one is horizontal and the other is vertical, and each is divided into 20 equal scales. Place them together to form a network and place the trend graph component on the top. Please note that the size of these three components (2 scale components and 1 trend graph) must be the same and they must be overlapped with each other, as shown in the figure below:

Add four numeric display components to display the values of LW0, LW1, LW2 and LW3 respectively.

Add four timer components to perform periodic circulation for the data of LW0, LW1, LW2 and LW3 respectively. The corresponding minimum value is 0 and corresponding maximum values are 500, 1000, 1500 and 2000 respectively. The step length is 10 and cycle time is 0.5 second. Take data control of LW0 for example, as shown in the figure below: (for details about Timer Component, refer to 6.30)

Timer Component A	ttribution

The display effect of window 0 after completing editing is shown as follows:

Save and compile it, and then perform offline simulation. The operation effect is shown in the figure below:

6.20.2 Multi-page Trend Curve

Make the following modifications on the basis of the single-page trend curve shown in the previous example:

In the Trend Graph tab, select multiple pages in the Type drop-down list box.

Select 15 in the **No. of Pages** drop-down list box. Select the **Save Time** check box. Set the **Hold**, **Scroll** and **Time** register addresses respectively to LB100, LW100 and LW110, as shown in the figure below:

rend	l Gra	ph Co	mp	onen	t A	ttribu	tior)									×
Basic	: Attrib	ution	Trer	id Gra	phic	s Cha	anne	I Pos	ition								
Туре	e	Mulitip	•	A	ttr.	Start f	rom	Le 🝷	Sar	n. Time	1		Ρ	ageN	um. 15		
						🔽 Sa	ve T	ime	San	n.Plot	21			Chani	nel 4	-	
_ Co	ntrol A	ddress															٦
		HMI		PLC I	No.	Addr.T	уре	Addr	ess	Codel			Len				
	Кеер	HMIC	•	0	•	LB	•	100		Forma	t:DD	DDD			Use Ac	ldr. T ag	
◄	Roll	HMIC	•	0	•	LW	•	100		BIN	•	3	•		Use Ac	ldr. Tag	
•	Time	нміс	•	0	•	LW	Ŧ	110		BIN	•	12	Ŧ		Use Ac	ldr. Tag	
																OK	

The settings for the track lines remain unchanged, as shown in the figure below:

end G	iraph C	omponent	Attributio	n i		
asic Al	ttribution	Trend Graph	nics Channe	Position		
No.	Lin	Data type	YZero	YSpan	Color	
0 1 2 3	333	signed int signed int signed int signed int	0 0 0	500 1000 1500 2000		

Add two scale components and five vertical lines. One scale component is horizontal and the other is vertical, and each is divided into 20 equal scales. Place them together to form a network and place the trend graph component on the top. Please note that the size of these three components (2 scale components and 1 trend graph) must be the same and they must be overlapped with each other, as shown in the figure below:

Settings for four timer components remain unchanged.

Add two multi-state setting (word setting) components to control the increase and decrease of LW100 so as to control the page up or page down operation. For the multi-state setting component controlling the value increase, set output address to LW100, set **Setting Mode** to addition, **Added Number** to 5, and the upper limit to a considerable large value. For the multi-state setting component controlling the value decrease, set output address to LW100, set **Setting Mode** to deduction, **Deducted Number** to 5, and the lower limit (Bottom) to 0.

Add a bit state toggle switch to control LB100 so as to control the trend graph whether to pause reading data. The settings are as follows:

The final display effect of window 4 is shown as follows:

Save and compile it, and then perform offline simulation. The operation effect is shown in the figure below:

Click **Stop** and the trend graph will hold still. Observe the page turning action. For each page turning operation, the position of the reference coordinate in the leftmost of the trend graph will move the distance of 5 (the inc. value or dec. value in the multi-state setting component) sampling points. There are totally 21 sampling points on the screen, and the 20 equal scales divide the screen into 20 blocks. Each block covers the distance of 2 sampling points.

6.20.3 Time Display

Add six numeric display components, with three placed in the lower-left corner of the trend graph and three in the lower-right corner. They represent the start point time (HH:MM:SS) and end point time (HH:MM:SS) of the coordinate respectively. Where, the addresses for them are respectively LW112, LW111, LW110; LW118, LW117, LW116. Numeric setting components are set as follows:

Data Display Cor	nponent Attri	buti	on				×

						OK

The configuration interface after setting is shown as follows:

The operation effect is shown as follows:

6.21 Recipe Data

The **Recipe Data** component can transfer data from the recipe memory of the touch screen to the PLC or from the PLC to the touch screen. For details, refer to Chapter 8.

6.22 Event Entry (Event Information Logon)

When a particular event occurs, a corresponding message will be displayed on the screen if it has been registered in the **Event Entry List** before. The message to be displayed on the **Event Display** component must first be registered in the **Event Entry** list. A PLC bit or word register controls each message. If the PLC bit or word device activates (either by ON/OFF switch or value limit exceeding), the corresponding message is displayed on the **Event Display** component. (This component is only used for event entry. To display an event message, the **Event Display** component is required.)

Procedure to add/modify event entry message

1. Click the icon, and the event message object library pops up, or enter the event message entry page in the "Library" menu in the menu bar.

E	vent log o	bject list				X
	No.	PLC	Address	Tirgger	Condition	Content
	Add	Delete	Modify			Exit

2. Click the **Add** button to add message or click the **Modify** button to modify the existing message.

(1) Address:

Data Type: Select the node register corresponding to the event as bit or word address.

Address Type: Select the address type of the register corresponding to the event. Address type vairies with PLCs.

Address: Designate the PLC bit or word register address to trigger the event. Code Format: BIN or BCD.

(2) Attribution:

Event Trigging:

Bits: When Data Type is set to "Bit", the attribute can be set as follows:

ON: Displays message when bit is ON. OFF: Displays message when bit is OFF.

Condition

Words: When Data Type is set to "Word", the condition can be set as follows:

Use "<" to trigger when value in word register is less than preset value. Use ">" to trigger when value in word register is greater than preset value.

Print:

On Trigger: Prints out message when event is triggered.

Return to Normal: Prints out message when the event returns to normal state.

(3)Trigger Function:

Execute Macrocode: If the corresponding event is triggered, it will execute the macrocode set here.

Pop Window: If a registered event is triggered, the corresponding event information will be displayed on the event display area. When the information is acknowledged (pressed on the screen by the operator), the designated window will pop up. To close the pop up window,

place a function key component with the function of closing window.

Write Data: If the corresponding event is triggered, it will write 0 or 1 in the bit address set here, or perform "NOT" operation on the current word value.

Note: The "Trigger Function" is an optional function. If there is no need to use those functions, leave the checkbox unselected.

(4)Text: Enter the content of the event message and select font color and size.

Note: Data from internal memory can be embedded in an event message. To embed a value, use the following format: **%nnd.** Where: **"%"** is the starting delimiter; **"nn"** is the internal register (LW) number 00-99; and **"d"** is the ending delimiter. For example: The content is set as "Current temperature value %25d: UPPER LIMIT ALARM". If LW25 = 120, then the message will be printed out as "Current temperature value 120: UPPER LIMIT ALARM". To print out current value of PLC register data, you should first assign a data transfer component to move data from the PLC to internal memory (LW).

 Click the OK key and the event message will be displayed in the Event List. After entering event message, you can edit existing message through the Delete and Modify button. Press Exit to exit event entry.

ent log	object list					
No.	PLC	Address	Tirgger	Condition	Content	
0 1	PLC0:0 PLC0:0	LB:10 LW:30	On	> 80	LB10 is on Temperature over 80 degree!	
Ad	d D	elete	Modify		Exit	

Note: In order to improve communication efficiency, it is recommended that a block of continuous PLC bit devices be used for the **Event Entry** component. For example: Use Bits100 to 199 to control the display of all event messages. In this case, one read command reads Bits100 to 199 all at once instead of one bit at a time.

6.23 Event Display

The **Event Display** component display messages in prioritized order in designated windows. Various formatting features allow the display of event trigger, acknowledge and return to normal times. The use of the Real Time Clock (RTC) or reading time from the PLC is required for proper display of the time.

(This component is only used to display event messages. To enter an event message, the Event Entry component (Event Information logon)is required.)

Adding event display

1. Click the **Event Display** component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Event Disp	lay Com	рог	ient At	tribution							×
Basic Attribution Event Display Component Position											
Priority Normal -											
- Input Ad	dress				- Output Add	dress —				_

			\square	

Note: Be sure to allow sufficient character length to accommodate all messages. If the Format message and message text exceed the **Character** length, the message is truncated.

As for the method for obtaining day and time, refer to Section 11.3, "**Nonvolatile Local Word**" (LW10000 ~ 10006).

RTC			
Address	Description	Note	Data Type
10000	RTC second	Value range 0 - 59 (R/W)	
10001	RTC minute	Value range 0-59 (R/W)	
10002	RTC hour	Value range 0-23 (R/W)	
10003	RTC day	Value range 0-31 (R/W)	BIN code
10004	RTC month	Value range 0-11 (R/W)	
10005	RTC year	Value range 0-9999 (R/W)	
10006	RTC week	Value range 0-6 (R/W)	
Note on R	rc:		I

A user can display system time with a corresponding component, with its value writable. However, the user has to make sure its value must be within the value range; otherwise, the operation will be ignored and the current time value will not be modified.

3. Click **[OK]** and adjust the position and size of the event display component.

Example of Event Display

- 1. Create a new project
- 2. Enter two event entries to the **Event log object list**, as shown below:

No.	PLC	Address	Tirgger	Condition	Content
) 	PLC0:0 PLC0:0	LB:10 LW:30	On	> 80	LB10 is on Temperature over 80 degree!

Where, the first event corresponds to pop-up window 4 and the second event corresponds to pop-up window 5.

3. Add an event display component to window 0, as shown in the figure below:

E	vent Displa	y Com	por	ient Att	ribution							×
	Basic Attributi	on Eve	ent (Display Co	omponent P	osition						
	Priority	Normal		Ŧ

		Extended Date Format(Y/M/D)	- 1
Select	t Area Color 🛛 🔻]	
			_
		OKOK	

A vectogram is placed under the event display component to serve as the background image.

- 4. Add a bit state toggle **switch** to control the ON/OFF state of the LB10 ,a static text with the content "LB10" and a bit lamp for displaying the status of LB10.
- 5. Add a static text component to display the content of "Current temperature" and a numeric input component for displaying and change the value of LW30.
- 6. Add two Word Setting components for change the value of LW10, which is the input address of the event display component. One of the two word setting component adds 1 to LW10 when pressed and the other substract 1 from LW10 current value when pressed. The user can use the two buttons for view the event information on the event display area. Note that lower and upper limits should be set for LW10 to avoid unpredicted errors.

Detter MA					

8. Create window 5, as shown in the figure below, resize the window to 320×85, place a numeric input component for setting the LW30 register. The window will appear on the top half of the window when LW30 event information is pressed.

9. Save and compile the project, then perform online/offline simulation or downloading. The operation effect is shown in the figure below:

Figure 1, LB10 event is triggered and displayed on the event display area.

eview of the second sec
LB10 is on! Please check the system!
0 13:45 LB10 is on
LB10 Ourrent Temprature

Figure 2. When the user touch the event information on the event display area, window 4 pops up. The user can close the window or toggle the state of LB10. Note that the event information which has been acknowledged is shown in different colors which are designated in the event display component attribution dialogbox.

		eview
Temperature is above 80 degree!	Close	99
1 13:49 Temperat 0 13:45 LB10 is	ure over on	
	Current Temprature	99

Figure 3. When the "Current Temperature" register is set to 99, above the limit of 80, the LW30 event is triggered and the corresponding event information is displayed on the window. Touch the information will pop up window 5 on the screen. Note that the color of event information 0 has been changed to white, which means the LB10 register has returned to its normal state.

Note:

a. Do not select the print function if the panel doesn't connect with a printer (On Trigger, Return to Normal). If the print function is selected but no printer is connected, once the event is triggered, the touch screen will display: Print error, which will flicker on the screen.

b. Pop up windows will only be displayed when the corresponding event information is acknowledged by the operator. To close the pop up windows, place a function key component with the function of closing window on it.(For details about function key components, see section 6.?)

6.24 Alarm Bar

The **Alarm Bar** displays triggered alarm messages in the alarm bar area in scrolling way like a banner moving from the right to the left. The messages must be linked to some bit node addresses. The messages are scrolled from right to left in order of triggering. Alarms continue to scroll until they switch to the inactive state. Alarm messages must be entered in the **Alarm Entry**

(Alarm Information Logon) component in advance. (This component is used only to display alarm message. To enter alarm messages, the **Alarm Entry** component is required.)

Adding an alarm bar

1. Click the Alarm Bar component icon and drag it to the window, the **[basic attribution]** tab of the component appears.

Alarm Bar Com	iponent At	tribution							
Alarm Bar Posi	Alarm Bar Position								
Moving Step	10	Pixel							
Moving Rate	10	* 100 MilliSecond							
Description	ABO								
			ОК						

For the moving step and moving speed, the higher the value is, the quicker the scrolling speed will be.

Moving Step: Distance of a step in each moving operation, in the unit of pixels. Bigger step distance means faster movement.

Moving Speed: Time interval between two moving operations, in the unit of 100 ms.

Description: A reference name (not displayed) that you assign to the alarm display component.

• Example of placing an alarm bar

- 1. Create a new project.
- 2. Click the Alarm Information Logon component icon to enter the Alarm List. Add two alarm messages, as shown below:

lo.	Address	Alarm	Content	
	LB:1	On	LB1 is on!	
	LB:2	Off	LB2 is off!	

3. Add an alarm bar in window 0. Set the Moving Step and Moving Rate parameters like the following figure:

Alarm Bar Com	Alarm Bar Component Attribution 🛛 🔀								
Alarm Bar Posit									
Moving Step	10 Pixel								
Moving Rate	10 * 100 MilliSecond								
B 14	ABO								
Description	ABU								
		OK							

4. Add two bit state toggle switches and two bit lamp to control and display the ON/OFF state of the LB1 and LB2. The ON/OFF state directly triggers the display of alarm messages on the alarm bar.

5. Save and compile the project, and then perform online/offline simulation or downloading. The operation effect is shown in the figure below:

Since the LB1 is set to ON and LB2 is set to OFF, both alarm conditions are met. The two alarm information is displayed on the defined alarm bar area. The colors are different for two alarms, that make them more easy to be distinguished from each other.

6.25 Oscilloscope

The **Oscilloscope** component has similar functions with the **Trend Graph** component. The difference is that when the current window containing the trend graph closes, the background data acquisition continues; therefore, when a user switches back to the trend graph at any time, the user can obtain the sampling information before the switchover. However, the data acquisition of the oscilloscope is only valid on the current page; in other words, after each switchover, the system will not sample oscilloscope data and the data will get lost. When a user switches back to the oscilloscope window, it will resume data sampling from the very beginning. The advantage of an oscilloscope is that a user can monitor multiple waveforms, for which the long-term monitoring is not necessary, without adding extra background processing loads. Meanwhile, the oscilloscope provides variable-rate sampling function, which when cooperating with a PLC, enables a user to obtain higher sampling frequency, without being restricted to the frequency of 1 point per second.

Procedure to add an oscilloscope

 Click the Oscilloscope component icon and drag it to the window, the basic attribution tab of the component attribution dialogbox appears.

Oscillograph Component Attribution										×
Basic Attribution Oscillograph Channel Position										
Priority Normal -										
- Input Addre	Input Address Output Address									
НМІ	HMIO	•	PLC	0 -	нмі	HMIO	Ŧ	PLC	0 -	
Addr. Type	LW	•	Addr.	0	Addr.Type	LW	Ŧ	Addr.	0	
Code Type	BIN	•	Forma	tDDDDD	Code Type	BIN	Ŧ	Format:	DDDDD	
Word	1	Ŧ	📕 Us	e Addr Tag	WordNo.		Ŧ	📕 Usev	Addr Tag	
Description OSO										
									OK	

Input Address: Specify the PLC word register address corresponding to the first curve, the second curve data register is located at **Read Address** + 1, and the third is located at read address + 2, etc

Address Type: Select the address type of the register corresponding to the oscilloscope, that is, the monitored register's address type. The address type varies with PLC type. Alternatively, you can also use the internal register of the HMI. For internal registers of HMI, refer to Section 5.4. Please note that some internal registers of the HMI are reserved by the system. Do not use these registers. For details, refer to Chapter 11.

Address: The initial address of the word registers corresponding to the curves in the oscilloscope component.

Code Type: BIN or BCD.

No. of Words: Depends on the number of sampling channels (curves). If the number of channels is N (1<=N<=16) (which means there are N curves to be shown), the **No. of Words** is N.

Use Address Tag: Whether to use the address entered in the address tag library. For details, refer to Section 6.35.

Description: A reference name (not displayed on the runtime screen) that you assign to the

oscilloscope component.

2. Go to the [Oscillogram] tab to set related parameters:

Oscillograph Component Attribution									
Basic Attribution Oscillograph Channel Position									
Type Mulitip	 Attr. 	Start from L ε	- Sam.Time	1	PageNum, 10				
Sam.Ratio 1	•	🔽 Save Time	Sam.Plot	10	Channel 2 🔹				
Control Address		Addr.Type Ad		Type Word					
🔽 Keep HMIC 🗸	0 •	LB - 3	FUIIIR		🔲 Use Addr. Tag				
Roll HMIC -	0 •	LW • 5	BIN	• 3	👻 🔲 Use Addr. Tag				
Time HMIC -	0 •	LW - 10	BIN	• 12	🝷 🔲 Use Addr. Tag				
					OK				

Type: Single page or multiple pages.

If the user selects the single page mode, it will only display the data change of the sampling values in the current page. It does not allow the extension of the oscillogram. If the user selects multiple-page display, it allows the extension of the oscillogram. The data is displayed in the same way, but when the oscillogram rolls forward, the previous sampling data will not be discarded. Previous data will be saved to the memory for future reference. Please note that a maximum of 31 pages of historical data are available, which is determined by the **No. of Pages** parameter.

Attribute: Start from left or start from right. In other words, it determines whether the oscillogram is displayed from the left to right or from the right to left when displaying sampling data.

Sampling Time: Time interval between two sampling points, in seconds.

Sampling Ratio: When selecting values other than 1 for this parameter, the oscilloscope will read the multiple groups of data at a time and display them. For example, if the input address is LW10, number of channels set to 3, and sampling ratio set to 2, the oscilloscope component actually read data from 6 registers (LW10-LW15) at a reading operation. The six registers form 2 groups: group 1 is composed of LW10, LW11 and LW12 while group 2 covers the other three. When the sampling time is 1 second, it will read these two groups of data in each second. It is required that the PLC should prepare these two groups of data in advance at a sampling speed of 0.5S and store them in the corresponding addresses. The oscilloscope can read display two 0.5S data at the same time in one second, so as to display the curve effect of the 0.5S sampling cycle.

Save Time: If this check box is selected, the **Time** box in the **Control Address** frame is available.

Sampling Plot: Number of sampling points for one curve displayed on the graph.

No. of Pages: When the Type is set to "Multiple Pages", this box is available.

Channel: Number of tracks to be displayed, corresponding to the number of word addresses of the PLC data. One word register corresponds to one track.

Hold (Keep): The bit address that controls the start or stop of the oscillogram; in other words, the data sampling stops when the [**Hold**] bit is turned ON, and the sampling continues and oscillogram will be dynamically displayed when the [**Hold**] bit is turned OFF.

Roll: Changing the value of this register can implement scroll display of the graph. Each incremental unit can move the oscillogram leftward/rightward by one sampling point. For example, create two numeric setting components, with their register addresses the same as the address of the register controlling the scrolling. Set one component to addition and the other to deduction. In this way, it can turn the oscillogram to the previous or next page.

Time: When the **Save Time** check box is selected, the **Time** box in the lower part of the window will be activated. It includes 12 word registers used to save the time of the latest sampling point. The registers are restricted to HMI local words, the user can specify address for them.

3. Go to the [Channel] tab and set related parameters of each track.

cillog	raph C	omponent A	ttributio	n		
Basic At	tribution	Oscillograph	Channel	Position		
No.	Lin	Data type	YZero	YSpan	Color	
0	1	signed int signed int	0	5 5		
		olghoo int		·		
						OK

Color: Designate the color of each track.

Line Width: The width of a line, including 8 options.

Data Type: Sets the data type, with only two options of signed integer and unsigned integer.

Max. and Min Value in Y Direction: Set the corresponding maximum and minimum values of each track line along the Y direction.

4. Click **[OK]** to complete the setting of the oscilloscope component.

6.26 Scale

The **Scale** is used with trend graph, oscilloscope or XY plot components. It can also be applied on other occasions. Often, it is used with meter component.

Adding a Scale

1. Click the Scale component icon and drag it to the window, and the **[Scale Component Attribution]** dialogbox appears.

Scale Component	t Attribution	×
Scale Position		
Style	Are •	
Equal Division	IE	
Line Length	10	
Start Angle	0	
End Angle	180	
Line Col	lor 👻	
	OK	

Style: Set the style of the scale: vertical, horizontal, arc, or round. As the following figure shows:

Divisions: Select the number of divisions on the scale.

Mark Length: Select the length of scale mark.

Starting Angle/Ending Angle: Starting angle and ending angel of the arc.

- 2. Go to the **[Position]** tab and adjust the size and position of the scale component. Position and size of it can also be set by using the mouse to drag the component.
- 3. Click **[OK]** to complete the setting.

6.27 Scroll Bar

The **Scroll Bar** is used to control the scrolling of a selected graph, usually trend graph or oscillograph in multiple page mode. It includes word or double word register to define the scrolling scope of the scroll bar.

Adding a scroll bar

1. Click the **Scroll Bar** icon and drag it to the window, the **[basic attribution]** tab of the **[component attributions]** dialogbox appears.

Scrollbar Component Attribution									
Basic Attribution Scroll Bar Position									
Priority Normal									
Input Address Output Address									
HMI HMIO - PLC 0 - HMI HMIO - PLC 0 -									
Addr. Type LW - Addr. 0 Addr. Type LW - Addr. 0									
Code Type BIN - Format:DDDDD Code Type BIN - Format:DDDDD									
Word 🗾 🗸 🗖 Use Addr Tag WordNo. 3 🔹 🗖 Use Addr Tag									
Description SCR0									
ОК									

Output Address: The first word or double word register is used to save the current position value; the second word or double word is used to save the position value of the starting point (that is, the starting point in the left or upper most part of the scroll bar, depending on the scroll direction of the scroll bar); the last word or double word is used to save the position value for the end of the scroll bar (that is, the ending point in the right or lower most part of the scroll bar). When you change the value of the first word or double word, the scroll bar will move towards the direction set by you (from left to right, from right to left, from top to bottom, from bottom to top). The step of each motion is 1, and the range of motion is determined by the following two words (double words) registers. Alternatively, you need not set the value of the

first register; instead, move scroll bar directly with your hand, the system will calculate the current browsing index value and write the first word or single word based on the ratio of the position on the whole scroll bar.

Address: The initial address of the word registers corresponding to the scroll bar. Code Type: BIN or BCD.

No. of Words: No necessary for the user to change the setting, disabled here.

Use Address Label: Whether to use the address entered in the address label. For details, refer to Section 6.35.

Description: A reference name (not displayed) that you assign to the scroll bar.

2. Go to the **[Scroll Bar]** tab:

Scrollbar Compone	nt Attribution		×
Basic Attribution Scr	oll Bar Position		
Index Length	Word 🗸	Direction From Left -	
Background Picture	Use Vector Dig 💌	Image NUM_KEY001.v - StateNo. 0	•
AdjustingKnob Pic.	Use Vector Dig 💌	Image NUM_KEY001.v - StateNo. 1	•
		0	ĸ

Index Length: Select word or double word.

Direction: Moving direction of the scroll bar, including from left to right, from right to left, from top to bottom, from bottom to top.

Background Picture: The background image to be used by the scroll bar, including such options as **Not Use**, **Use Bitmap**, and **Use Vectogram**. If you select the **Use Bitmap** or **Use Vectogram** option, select a desirable bitmap or vectogram in the **Image** drop-down list box. At the same time, you can select the corresponding **State No.** for the bitmap or vectogram.

Adjusting Knob Image: The adjusting button image to be used for scrolling images, including such options as Not Use, Use Bitmap, and Use Vectogram. If you select the Use Bitmap or Use Vectogram option, select a desirable bitmap or vectogram in the Image drop-down list box. At the same time, you can select the corresponding State No. for the bitmap or vectogram.

3. Click **[OK]** and adjust the position and size of the scroll bar component.

• Example of Using the Scroll Bar

Add a scroll bar component to the multi-page trend graph described in Section 6.20.2. Set the output address to LW100, consistent with the scrolling address of the trend graph.

									ОК

Adjust the length of the scroll bar to the same as that of the trend graph. The configuration after setting is shown as follows:

The operation effect is shown as follows:

When the display remains still, click a position in the scroll bar to move the current display to the corresponding page in historical data. It implements the browsing function similar to that in a Windows system and it is easy to use.

6.28 Message Board (Note Pad)

The message board is used as a canvas for users to save and transfer messages. The user can write some notes on the HMI at will. It is similar to the **Paint**, but we can only user fingers or a stylus to write on the message board.

Procedure to add a message board (Note Pad)

icon and drag it to the window, the [Message Board Properties] dialog

box appears.

Click the

1.

Message Board Component Attribution	×
Message Board

Fi Re d Ekser		FK7	FK8	FK9	FK10
Blue	Pen Width		4	6	8

After setting these options, save and compile the project, perform online/offline simulation or downloading. The operation effect is shown in the figure below:

Message Board	
Pen Erase Bloc CLS Red Green	!
Blue Pen Width 2 4 6	8

LB9020 - LB9022 are reserved by the system to control and identify whether the brush, eraser, and block cleanout functions are selected. LB9030 - LB9032 are used to set the pen width.

LB9006 is used to set message board operation mode. LW9007 is used to set the brush thickness. LW9008 can select any one color for the brush among all 256 colors. For details, refer to related parts in Chapter 11, "**Reserved Register Addresses of the System**".

Note:

- 1. Each HMI panel can use only one message board component. If there are several message boards, the contents must be consistent, as they share the same storage area.
- 2. Data in the message board will not be saved and will get lost after power failure of the HMI. Do not write recordable messages on the message board.

6.29 Function Key

The **Function Key** can be used to change screen display, input digit or ASCII character, maximize or minimize window and move window, design message board, or print.

Procedure to add a Function Key

 Click the Function Key icon and drag it to the configuration edit window, and the Function Key Component Attribution dialogbox appears. Click the Function Key tab to set the various function and behavior of function key component.

These functions are: Switch Window, Keyboard Function, Message Board and Print. The details about these functions are discussed below.

Function Key Component Attri	ibution 🛛 🛛
Function Key Trigger Addr Tag	Graphics Position
C Switch Window Change 👻	0:Frame0 + C Excute Marco +
• Keyboard Func. Enter	a 🚽 🖓 Map Keyboard
Mapping-Key C Message Board C Tool Pen C Pen Color C Pen Width C Clear	C Print Color C Black and White C Multicolor Magnify Multiple 1.0 Print Page C Current C Horizontal C Next C Vertical C Next C Vertical C Next C Vertical
	ОК

- 2. **[Trigger Address]** tab is reserved for special use, don't change the default setting here before contacting Stepservo Technician.
- 3. Go to the **[Tag]** tab:Select use tags and input the proper tag for the function key.
- 4. Go to the **[Graphics]** tab: Select vectogram or bitmap to display states.
- 5. Click OK and adjust the position and size of the **Function Key**.

6.29.1 Switch Window

If the function key component is used to manipunate the window, select the **Switch Window** option, there are some specific window operation options in the list on the right. Among them are **Change basic window**, **goto previous**, **change common window**, **change fast selection window**, **popup window**, **close window**, **move task bar** and **minimize window**.

Change Basic Window

If the this option is selected, when the function key is pressed, the current basic window (including all of its sub-windows) will be terminated and it will display the basic window designated by the window number selected from the list on the right. The basic window to be switched to must be an existing one so it can be selected in the list.

Goto Previous (Window)

This function closes the current basic window and recalls the last active basic window. It is only valid for basic windows.

For example, if basic window 21 is the basic window displayed just before window 32, and window 32 had a function key defined as **Return to Previous**, then, when the function key is pressed, the screen will be clear and displays window 21.

Change Common Window

If the function key is set as **Change Common Window**, when the touch area is pressed, the current common window will be replaced by the specified window as new common window. Also the new common window is designated by selecting from the list.

Change Fast Selection Window

This function changes the fast selection window. The window specified in this function must be the exact same size as the original fast selection window (window number 2 by default).

Pop-up Window

If the function key is set as "**Pop-up Window**", when the touch area is pressed, the window designated by window number selected from the list will be displayed over top of the current base

Pop-up window 100

window. The existing window(s) will not be terminated.

Close Window

A Close Window function key terminates the pop-up window where it is placed when pressed. However, it cannot close direct or indirect windows. The open/close of direct (indirect) windows are controlled by their corresponding bit (word) registers, and the **Close Window** function key can only close pop-up windows and cannot control the register data.

Popup Window Title Bar

A function key defined as **[Popup Window Title Bar]** is used to move the position of a popup window on the screen. A pop up window on the screen, that has a function key inside the window with the "popup window title barwindow bar" attributes, can be moved by touching the title bar then touching a another position on the screen, the window is moved to that place.

popup window 2. Touch on the position where the window should move to, it will be displayed there.

Minimize Window

you want to move.

If a pop up window on the screen has a function key set to perform **Minimize Window** function in it, when the function key is pressed, the window will be minimized to a window icon on the taskbar at the bottom of the screen. A touch on the window icon will maximize the window again.

A comprehensive example of function key related to window manipunation:

In this section, we provide a detailed example containing all the function related to window

manipunation. After finishing the application project under the following instructions, the user can simulate this project to observe the behavior of these function keys. Also, the user can get a better understanding of some basic conception about window such as basic window, fast select window, common window and task bar.

- 1. Create a new project and save it. (Select any type of PLC for this project doesn't use any PLC register.)
- 2. The default project wizard has five windows: basic window 0, window 1 with two direct window components for the default number input keypad, window 2 as the default fast selection window, window 3 as the default number input keypad and basic window 4. They are in the project after creating and cannot be deleted. After creating the project, the window shown in

the edit area is window 0, use **E** 1:Frame1 **T** to change the window shown in the edit area. Double click in the blank area of a window will envoke the **Window Attribution** dialog box of that window. Shift to window 2, the default fast selection window, and double click to show the Window Attribution dialog box. There you can see that the window is 100 pixels

wide and 220 pixels high with a frame of the width of 5 pixels. Click to add a new window into the project, the new window will be designated widnow 5. Open the window attribution dialog box to set the size of window 5 the same as window 2 and add the same kind of frame. Add two more window: window 6 and window 7. Window 6 will be used as a basic window and window 7 will be a pop-up window. Change the size of window 7 to 200 pixels wide and 150 pixels high.

3. Place three function keys on window 2, that is, two Change Basic Window function keys can switch to basic window 0 and basic window 4 respectively, and a Change Fast Selection Window function key can switch current fast selection window from window 2 to window 5. Add tags for these function keys for indicating the operator the function they will conduct when pressed, the finished window 2 is shown as below:

4. Click A on the drawing toolbar to place a static text component on window 1. The content of

the text is "Common Window 1".

5. Place a static text component on window 0 with the content "Base Window 0". Place a function key whose function is Goto Previous and labeled as "Return", and a Pop-up Window function key with the label "Popup window 7" to pop up window 7, as shown in the figure below:

6. Place a text component on window 4 to display the text of **Basic Window 4** and a **Return to Previous** function key with the lable "Return".

Basic Window 4	
FK1 Return	

Place a Fast Selection Window function key on window 5 for switching to fast selection window 2, a Change Common Window function key for setting window 1 as the current common window, and a Change Common Window function key for setting common window 6 as the current common window.

- 8. Place a static text component with the content "Common Window 6" on window 6.
- 9. Place a **[popup window bar]** function key on window 7 to display the title of Pop-up Window, a **[Minimize Window]** and a **[Close Window]** function key.
- 10. After setting these options, save and compile the project, run online/offline simulation or downloading. The operation effect (simulation) is shown in the figure below:

	erection of the second s
Basic Window 0	Basic Window 0 ommon Window 1
Basic Window 4	Popup
Fast Select Window 5	Popup window 7
	Return
Menu isk Bar	T P A

11. Press function keys in a fast selection window to switch from window 0 to window 4, press **Return** to return to window 0. Then, press **Return** in window 0 to return to window 4.

12. Press **Pop-up Window** in window 0 to pop up window 7, as shown in the figure below: (The user can move, minimize or close the pop-up window.)

	View 🛛
Basic	Basic Window 0 ommon Window 1

13. Press **Fast Selection Window 5** in the fast selection window to switch to fast selection window 5, as shown in the figure below:

	eview of the second

	ŪK

A keypad is composed of a variety of function keys with different ASCII codes (0, 1, 2... and a, b, c...) and special keys such as "Enter", "BS", "ESC" and "CLR" etc. Since any character can be assigned to a function key, specialized keypads can be made for any application. Keypads are used with the **Numeric Input** or **Text Input** components to enter numeric values.

- Create a keypad for numeric input component
- 1. Create a new window, place **function key** components used for input the numbers and characters: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ENT, BS, CLR, "-", ".", as shown below:

Set the FK_0 for input digit "1" as follows:

	ок

Set other function keys (FK_1~FK_14) as follows: Other characters (2) ~ (9), (0), ENT, CLR, BS, -, ".".

- 3. Put a Number Input Component in window 0 and set the necessary parameters (see relative sections for details.).
- Save and compile the project, conduct the off-line simulation. When the Numeric Input component is activated, the function keys (FK_0 ~ FK_14) become the keypad for numeric input.

6.30 Timer

Č Timer

The **Timer** is a timing device and will execute corresponding function when the timing time arrives. It can implement such function as executing macro code, setting parameters, and transferring data.

• Various Functions of Timer

 Click the Timer component icon and drag it to the window, and the [Timer Component Attribution] dialog box appears. Click the [Timer] tab:

Timer Component A	ttribution					×
Timer Timer Functio	n]					
Basic Attribution-			Trigger Address-			
Trigger Mode 🔠	ime	•	НМІ	HMIO	Ŧ	
Exe.Cycle(100ms)	30		PLC No.	0	T	
Response Mode	Immediate	•	Address Type	LB	Ŧ	
Response State	Off	•	Address	0		
Repeat Times	0					
					01	

Basic Attribution

[Trigger Mode]: Include such options as All time, Initial Frame (Triggered at Window Initialization), Close frame (Triggered at Window Close), and by register address (Triggered by Register State).

Always TriggeredAll time:

If this option is selected, the timer will be triggered upon initialization regardless of the trigger mode to execute the triggered operations until the times designated by the **[Repeat Times]** reach. Then, it will not be triggered until the next initialization.

Initial Frame:

The timer will be triggered upon initialization of the window to execute the triggered operations until the times designated by the **[Repeat Times]** reach. This function is basically the same as the **All time** mode.

Close Frame:

The timer is triggered only once when the window closes.

Triggered by Register State:

The timer will be triggered according to the setting of the **Trigger State** and the value of the register designated by **[Trigger Address]**. When the **[Repeat time]** is 0, it will continue to execute the triggered operation until the trigger condition is cancelled. If the **[Repeat time]** is N, it will clear trigger register once triggered, and then trigger N operations before it automatically stops.

[Execution Cycle]: The timing cycle of the timer, in the unit of 100 ms. The timer will execute the triggered operation at an interval of the execution cycle.

[Response Mode]: Determines whether to execute the operation immediately or delay in execution. Executing immediately means it will be triggered immediately when the trigger condition is satisfied. Delayed execution means it will be triggered after the delay of an

execution cycle once the trigger condition is satisfied.

[Response State]: Determine whether to trigger the timer by the value of ON or OFF when it is triggered by the register.

[Repeat Times]: Means the number of repeated operations after the timer is triggered. Refer to the description of the execution times for each trigger mode. If the Repeat Times is set to 0, the timer will be triggered whenever the condition is satisfied.

[Trigger Address]: Address of the register to execute corresponding functions when the timer is triggered by the register (Note that the address must be a LB address).

Timer Compone	nt Attribution					
Timer Timer Fu	nction					
- Basic Attributio	n		Trigger Address-

Response Mod	e Immediate	•	Address Type	LB	Ŧ	
Response State	e Off	•	Address	200		
Repeat Times	1					
						JK 🛛

2. Go to the [Timer Function] tab:

There are three function blocks: Execute Macro, Data Transfer and Set Satus

(1) **Execute Macrocode**: The macrocode to be executed each time when the timing time arrives.

(2) **Data Transfer**: Implement data transfer function when the timing time arrives and transfer data of corresponding length from the source address to the destination address.

Source Address: Starting address of the register containing the data to be transfered

Destination Address: address of the transfer destination register

Data Type: Select to transfer data of bit or word type.

Data Transfer Length: Length of the data to be transferred (number of the bits or words)

Timer Comp	onent	A	ttribution								X
Timer Time	er Funct	ior	ו

		_			_						
									L		OK

(3) Set Status: Set specific register value when the timing time arrives.

Set Address: address of destination register to be set when the timing time arrives *a. Set the bit register:*

Set Mode: Set value and Periodic Toggle, as shown in the figure below:

Timer Comp	onent	Attribution								
Timer Time	er Functio	on								
C Execute	e Macro	macro 0.0		9	Set Status					-1
🔿 Data Tr			estination	_	Set Mode	Set va	lue			-

000000,00		00000,0			CodeStyle	BIN	•			
Data Type	Bit	Data Len.	20							
				_	^					
								L		OK

Detailed description of different functions is as shown in the table below:

Туре	Description
Set Value	Set the designated bit register to 0 or 1 when the timing time arrives.
Periodic Toggle	The value of the designated bit register flips its status(ON/OFF) when
	the timing time arrives.

b. Set word register:

Set Mode: Periodical JOG++, Periodical JOG--, Periodical Bounce, Step up, Step down, and Set Constant value, as shown in the figure below:

Timer Component Attribution	
Timer Timer Function C Execute Macro C Data Transfer Source Destination HMI HMI HMI HMI PLC No. PLC No. Addr. Type B Address Address CodeStyle BIN Data Type Bit Type Data Len.	Set Status Set Mode Periodical JOG++ Se Periodical JOG++ Periodical JOG-+ HMI Periodical Bounce Step up Step Down Addr.Type Address O Upper Upper O CodeStyle BIN •
	OK

Detailed description of different functions is as shown in the table below:

Туре	Description
	Automatically the incremental value is added to the current value of the
Periodical	designated PLC word register in every interval. The interval is defined in
JOG++	Execution Cycle. When the value reaches the upper limit, it starts at 0
	again.
	Automatically the subtracted value is subtracted to the current value of the
	designated PLC word register in every interval. The interval is defined in
	Execution Cycle. When the value reaches the lower limit, it stops at the
	lower limit.
Periodical JOG	Upper Limit T V-K Lower Limit N0
Periodical Bounce	The operation becomes active when the window is open. The incremental Value is added to the current value of the designated PLC word register at regular intervals as specified by the Execution Cycle until the Upper Limit is reached. Then the incremental value is subtracted from the designated PLC word address until zero is reached. This cycle is repeated unconditionally.

3. Click [OK] to complete the setting and adjust the position and size of the timer component.

6.31 Video Components (Only Applicable to MT5600T/MT5700T)

Video components are used for real-time emonitoring. They can be used for real-time monitoring on industrial fields.

1. Click the **video** icon, drag it to the window, and the **[Basic Attribution]** tab of the **[Video Component Properties]** dialog box appears.

Video Fr	equency	Com	iponer	nt Attributio	n								
Basic Att	Basic Attribution Position												
Priority	Norma	al	Ŧ										
/ Input	Address		_		Output Ad	dress —

Word	. 4	Ŧ	F U:	se Addr Tag	WordNo.		Ŧ	🗖 Us	e Addr Ta	g			
Descript	tion VD()											
										ок			

[Input Address]: Four consecutive word registers are used for save parameters of the **Video Component**. The [Input Address] indicates the starting address of those word registers. The first word indicates channel switching (the two channels are Channel 0 and Channel 1), the second word indicates brightness adjustment (adjustable range: $0 \sim 255$), the third word indicates the contrast adjustment (adjustable range: $0 \sim 255$), and the fourth word indicates chroma adjustment (adjustable range: $0 \sim 25$).

[Address]: The starting offset address of the word register corresponding to a video component.

[Code Type]: BIN or BCD.

[No. of Words]: This cell is automatically filled with 4, the user can't change it..

[eUse Address Tag]: Whether to use the address entered in the address tag. For details, refer to Section 6.35.

[Description]: A reference name (not displayed) that you assign to the video component.

2. Go to the [Position] tab, and adjust the position and size of the video component if necessary.

Note: Video components can only be placed in a pop-up menu. They should not be placed in the base window.

For the window where the video component is located, the **[Video Page]** option in the **[Window Attribution]** dialog box should be selected.

- Place a word setting component, with the output address type set to LW, the address to "0", the [Setting Mode] to [Sub Value], the [eDec value] to "1", the [Lower Limit] to "0", and the [Tag] to "Channel-".
- Place a word setting component, with the output address type set to LW, the address to "1", the [Setting Mode] to [Add Value], the [Inc Value] to "8", the [Upper Limit] to "255" (value range: 0~255), and the [Tag] set to "Brightness+".
- Place a word setting component, with the output address type set to LW, the address to "1", the [Setting Mode] to [Sub Value], the [Dec value] to "8", the [Lower Limit] to "0", and the [Tag] to "Brightness-".
- 8. Place a word setting component, with the output address type set to LW, the address to "2", the **[Setting Mode]** to **[Add Value]**, the **[Inc Value]** to "8", the **[Upper Limit]** to "255" (value

range: 0~255), and the [Tag] set to "Contrast+"

- Place a word setting component, with the output address type set to LW, the address to "2", the [Setting Mode] to [Sub Value], the [Dec value] to "8", the [Lower Limit] to "0", and the [Tag] to "Contrast-".
- 10. Place a word setting component, with the output address type set to LW, the address to "3", the **[Setting Mode]** to **[Add Value]**, the **[Inc Value]** to "8", the **[Upper Limit]** to "255" (value range: 0~255), and the **[Tag]** set to "**Chroma+**".
- 11. Place a word setting component, with the output address type set to LW, the address to "3", the [Setting Mode] to [Sub Value], the [Dec value] to "8", the [Lower Limit] to "0", and the [Tag] to "Chroma-".
- 12. Place a function key component, and set it as a "pop window title bar" (See 6.29 for details).
- 13. Place a function key component, and set it as a "minimize window" (See 6.29 for details).
- 14. Place a function key component, and set it as a "close window" (See 6.29 for details).

The completed window 4 is shown as follows:

				Video Win	Idou			_×	
	Channe I+	Channe I –	Brightness+	Brightness-	Contrast+	Contrast-	Chroma+	Chroma-	
Menu	it Bar	Video Windo	W					ТР	A

Install a camera properly, download the project to the HMI, click [eChannel+/Channel-] to

switch between channels 0 and 1, click **eBrightness+/Brightness-]** to adjust the brightness, click **[Contrast+/Contrast-]** to adjust the contrast, and click **[Chroma+/Chroma-]** to adjust the chroma, so as to achieve the best camera effect. Click the Window Bar, and the entire window can be moved. You may select to close or minimize the window.

Note:

1. The video component window does not support offline simulation, indirect online simulation and direct online simulation.

2. The video window runs above the base window all the time.

6.32 Bitmap Component

Bitmap components are used static image as illustration or background. With this component, you can place images already imported into the bitmap library onto configuration window. For details about importing image to bitmap library, please refer to Section 5.6. The EV5000 supports the display of images in 65535 colors. It can display beautiful and vivid color pictures so that your operator interface looks more beautiful and pleasant.

How to add a bitmap component to the window:

1. Click the icon and drag it to the window. Select a bitmap you want to use from the drop list, as shown in the following:

Bitmap Component Attribution				×
Graphics Position				
Use Vector Graphics		199		
	<i>₽</i> -			
☑ Use Bitmap				
1.bg	•			
Import Graphics				
		Graphics State	0	•
				ок

- 2. Click [OK], adjust the position and size of the bitmap in the window if necessary.
- 3. For details about importing an image to a bitmap library, please refer to Section 5.6.

6.33 Vectogram Component

Vectogram Component is similar to **Bitmap Component**. You can directly place any vectograms already in the vectogram library in the window, without the need to designate any components.

1. Click the (Vectogram) icon and drag it to the window. Select the vectogram you want to use from the drop-down list, as shown in the following figure:

Vector Graph Component Attribution		
Graphics Position		
Use Vector Graphics		
lamp-1.vg ☐ Use Bitmap		
Import Graphics		
	Graphics State	0 •
		ОК

- 2. Press [OK], and adjust the position and size of the vectogram in the window if necessary.
- 3. For the creation of a vectogram, please refer to Section 5.6.

6.34 Text Library

The text library is a database for storing text contents, which can be used as tags of components. Text stored in the **[Text Library]** can be used for multiple components. In this way, repeated text input can be avoided. To use text in the library, select the check box **"Use Text Library"** in the **[Tag]** tab of the **[Component Attribution]** dialog box and select the text content you want to use. One of the greatest features of the Text Library component is the multi-language column feature. Each text entry in the library has four columns, where user can input the same text content in four languages. The user can change the column being displayed by changing a system reserved register, LW9130. The usage of **[Text Library]** is discussed in detail in this section.

Enter text content to the librarye

1. Click the kiele icon or select [Project Database]→[Text Library], and the text object library appears:

J	ext label lis	t				×
	Name	Language1	Language2	Language3	Language4	
	Add	Delete	anguage Settin			Exit

2. Then press [Add], and the following text input dialog box appears. Enter [Name]and [No. of States], and click [OK].

Add Text			X
Name	Noname		ОК
Sta. Num.	2	-	Cancel

3. In this case, the text is added to the text library. Press the symbol "+" after the **[Name]**, and the following figure shows the set **[No. of States].**

Text label lis	t				
Name	Language1	Language2	Language3	Language4	
⊡ Noname 0					
1					1
		0			
Add	Delete	anguage Settin			Exit

4. Then, enter characters for each state, as shown in the following figure:

Т	ext label lis	t				×
	Name	Language1	Language2	Language3	Language4	
	⊡ Noname 0	OFF	OFF			
	1	ON	ON			
	Add	Delete .a	nguage Settin			Exit

5. If you use two states, enter the corresponding characters in State 0 and State 1. After adding the text, click **[Exit]**.

xt label li	st				6
Name	Language1	Language2	Language3	Language4	
⊡ Noname 0 1	OFF ON	OFF ON			
Add	Delete	anguage Settin		Γ	Exit

6. Finally, you can use the previously added text in places where the **[Use Text Library]** can be used, shown as follows:

t Setting C	omponent Attrib	ution			
Basic Attributi	on Bit State Setting	Tag Graphic	s Position		
🔲 Use Tag Tag List	Language English	(USA) 👻 I	✔ Use Text Labra	ry Noname Noname	•
State No.	Content	Align	Font Size	Font Color	
0 1	OFF ON	Left Left	16 16		
	014	LOR	10		
,					
				ОК	_

If have not added any text to the text library, the [Use Text Library] is not acativated and in grey all the time. It is enabled only when you have added a text.

2. Language Setting

```
е
```

The languages corresponding to different values of the LW9130:

```
LW9130=0: Language 1
Contents in the "Language 1" column will be displayed.
LW9130=1: Language 2
Contents in the "Language 2" column will be displayed.
LW9130=2: Language 3
Contents in the "Language 3" column will be displayed.
LW9130=3: Language 4
Contents in the "Language 4" column will be displayed.
LW9130>3: Language 1
Contents in the "Language 1" column will be displayed.
```

Therefore, you can place some word setting components in the main interface to set the value of the LW9130, the tags of those word setting components indicate the language they stand for. Touch the word setting component corresponding to the desired language after the HMI panel has just powered on, so that the user can select appropriate interface language. To change the language, return to the main interface to select the language again. e

6.35 Address Tag

Address tag is a list for storing frequently used register addresses. It also saves a lot of time for the user, avoiding the trouble of reentering an address. You can use the address in the list in any place that supports the application of **[Use Address Label]**.

Its usage is described as follows:

Create an address tag in the Tag Library

Click the icon or select [Project Database] → [Address Label] on the toolbar, the address label library appears:

A	ddress Tag Lib	orary				×
	Name	PLC	Data Type	Address Type	Address	НМІ
	Add	Delete	Modify			Exit

2. eClick [Add], the following small dialog box titled "Bulid Address Tag" appears:

lame	PLC	Data Ty	pe	Address	Туре	Address	HMI
		Build Address	Tag				
		Tag Name	Tag (n	oname)	0	ĸ	
		НМІ	HMIO	•	Car	ncel	
		PLC No.	0	•			
		Data Type	Bit	•			
		Address Type	LB	•			
		Address	0				
		Code	BIN	•			
	L						

Tag Name: Enter the name you assign to the address label. A meaningful name can help the user recognize the purpose of that register. It is very useful when select address tags from list. **HMI**: Select the HMI panel corresponding to the tag.

PLC No.: Select the PLC station number corresponding to the tag.

Data Type: Select whether the tag is a Bit or a Word register.

Address Type: Select the address type corresponding to the tag: address types of the register vary with the type of PLC

Address: The address of the tag.

Code: The type of code of the data, BIN or BCD.

- 3. Enter the proper values efor the above eparameters, eeclick [OK], and the address tag entry
 - will appear in the library:

e pl pl perature	HMI HMIO HMIO	PLC PLC0:0 PLC0:0	Data Type Bit Word	Address Type LB	
				LB	
			"or d	vж	0 2
	Delete	Modify			Exit
	Add	Add Delete	Add Delete Modify	Add Delete Modify	Add Delete Modify

Using address tags

Select a component, open the **[Component Attribution]** dialog box, check the **[Use Addr Tag]** option and select the desired tag in the **[Addr. Type]** drop down list:

Bit Setting C	Bit Setting Component Attribution									\mathbf{X}
Basic Attribution Bit State Setting Tag Graphics Position										
Priority Normal -										
Input Address Output Address										
НМІ	HMIO	Ŧ	PLC	0	Ŧ	нмі	HMIO	▼ PLC	0 +	11
Addr.Type	×	Ŧ	Addr.	0		Addr. Type	add1	- Addr.	LB:0	
Code Type	BIN	Ŧ	Format	DDDD		Code Type		- Format	:DDDDD	
WordNo.	1	Ŧ	🔲 Use	Addr Ta	ag	WordNo.	1	🗸 🔽 Use	Addr Tag	11
Description	SBO									
									OK	

An address tag entered in the tag library cannot be changed in other places. To change it, the user must open the address tag library and do the desired operation.

Note: The data type of the component using address tag MUST BE CONSISTENT WITH the type of the tag. For example, when selecting a tag for a Bit component such as [bit lamp] or **[bit**

switch], only the tags of Bit type can be seen in the [Addr. Type] list. When selecting a tag for a Word component such as **[word setting component]** or **[multiple state display]**, only the Word tags can be seen in that list.

6.36 PLC Control

PLC Control is a list storing the PLC register events. Registers in the list are linked to specific functions. These functions are controlled by the value of corresponding registers. Functions supported by PLC Control library is listed in the following table. Once the "Register-Control" pair is logged in the list, it will automatically run like a background program.

Change window	To change the current window		
Backlight control	To Turn on/off the backlight		
Screen print	To print the current screen		
Report print	To print the content of the designated window		
Backlight control (return value)	Backlight control with return value		
Universal PLC control (data transmission)	To implement data transmission between the PLC address and the LW/RW		
Execute macro	To execute related macro instructions when the conditions are satisfied		

► The process for creating a PLC control component

1. Click the [PLC control Library] icon 🛋, the [PLC Control Object List] appears.

PLC control object 🛛 🔀			
No.	REG-Address	Control event	
110.		Control Cyclic	
Add	Delete	odify	Exit

- 2. Clicke [Add] to create a new PLC control entry. Click [Modify] if you want to modify the PLC control entry, and by clicking [Delete], you can delete the selected entry.
- 3. Correctly fill in the contents in the PLC control component dialog box.

Address Type: Designate the address type of the register to conduct these PLC control operations.

Address: Designate the address of the register to conduct these PLC control operations. Code Format: BIN or BCD.

Control Type: Designate the operation behavior. The following operations are supported: [Change Window], [Report Printout], [Write data to PLC (Current Base Window)], [General PLC Control], [Back Light Open/Close (With or without Write back)], [Screen Hardcopy], and [Execute Macro Program]. Their functions are described later. Macro No.: It refers to the number of the macro code to be executed when the [Control Type] is set to[Execute Macro].

- 4. Click [OK] to exit the PLC control component dialog box.
- 5. Click [Exit] again to exit the [PLC Control Object List].

Change eWindow

This operation needs the use of two consecutive word registers. When the register corresponding to the **Input Address** (address specified in the PLC Control dialog box) is changed to a valid window number, the current window will be closed, and the designated window will be displayed. The number of this designated window is read from the register of the [**Input Address**]. Then, that number will be written to the (Input Address) +1 register of the PLC.

Input address	Designate the target widow number
Input address + 1	Write the target window number here

PLC Contro	l			X
нмі	HMIO	•	PLC No.	0 •
Addr. Type	LW	•	Address	0
Code Type	BIN	•	VFormat:DD	1 2
			🔲 Use Add	dress Tag
Control Type	Chang	je W	indow	•
Macro Numb)er		-	
Open Add	dress Tag La	abrarj	y OK	Cancel

As shown in the above figure, we use LW0 to change window. Assume that the current window is Window 0. If LW0 changes to "4", the current screen will change to Window 4, and then the value "4" will be written back to register LW1.

Notes on "Change Window" function:

The [Change Window] operation carried out by the PLC control is similar to the [Change Window] operation carried out by Function Key component. The only difference is that it is triggered by the PLC register, instead of the touch operation. If the value of the [Input Address] register changes to a new valid window number, the current window will be closed, and the window designated by the Input Address will be displayed. Then, that number will be written into back to the register located at Input Address+1. This operation will be triggered only when the value of the [Input Address] changes. Only one screen change can be made every time when the value is changed once.

Report Printout

This operation is used to control the printout of a designated window by use of a **WORD** register. If the content written into this word address is a valid window number, the content of the window will be printed out. However, during the print, the window will not be changed to the printed window. Please refer to the descriptions of "**Report Printout**" in Chapter 10.

Write data to PLC (Current Base Window No.)

This function make the panel write the window number of the current basic window to a designated register. In this way, the PLC can know which window is currently displayed on the panel.

Note: When the current basic window is changed, the touch screen will automatically send the number of the new basic window to the designated word register.

General PLC Control

The **General PLC Control** function is used to control the data transmission between the PLC and the touch panel with PLC data registers.

There are four transmission mode:

- 1. PLC > RW (recipe data memory), with the type code of 1
- 2. PLC -> LW (local data register of the touch screen), with the type code of 2
- 3. RW (recipe data register) ->PLC, with the type code of 3

4. LW (local data register of the touch screen) -> PLC, with the type code of 4

The detailed descriptions are as follows:

Select [General PLC Control] for the [Control Type] in the PLC control component setting dialog box, and select the type and address of the control data register in the [Input Address] column, which should be in units of words. The system will automatically set the four consecutive PLC data registers starting from the [Input Address] to be [Data Transmission Control Register] for controlling the data transmission. Their detailed meanings and usage are as follows:

- [Input Address]: It indicates the transmission mode. As mentioned above, there are four modes. This register is used to store the codes of the control type. When new control codes are written into the register, the system will immediately execute related transmission. After the transmission is completed, the register will reset to "0".
- 2. [Input Address +1]: It indicates the size of the transmitted data block, that is, the number of words to be transmitted.
- 3. [Input Address +2]: It indicates the offset of the data register address of the PLC during transmission. Please note that this offset is referred to register located at [Input Address+4] as its reference origin. For example, suppose that we use a MODBUS PLC, If the [Input Address] set for the [PLC General Control] component is 4X100, and the data in the register "4X102" is 4, the start address of the data block in the PLC during the transmission is 4X108=[(100+4)+4].
- 4. [Input Address+3]: It indicates the address offset of the recipe register (RW) or the local data register (LW) of the touch screen during transmission. The offset is referred to "0". For example, in the above example, if the data of the register "4X103" is "100", the start address of the data block in the touch screen during the transmission is RW(LW)100=(0+100).

Application examples:

Suppose that we need a PLC to control the transmission of 30 words from registers starting with "4X10" in the MODBUS PLC to the data block of the same size starting from RW200 in the recipe memory of the touch screen. The implementation is described as follows:

 Designate four data registers starting with DM10 to be used to control data transmission. Thus, first we need to input an entry of PLC control component to the PLC Control Library, select "General PLC Control" for the type, and set the Input Address to 4X10.

- Next, determine the data block size and the address offset. Set "4X11" to "30", indicating that the size of the transmitted data block is 30 words. Set "4X12" to "86", indicating the source start address of the operation is "4X100=(14+86)" of the PLC. Set "4X13" to "200", indicating the destination address is RW200=(0+200).
- 3. Finally, based on the data transmission direction, set the transmission type code to execute the transmission process. "4X10" should be set to "1", indicating that the data of the PLC data block with the set start address will be transmitted to the data block of the recipe memory of the touch screen with the set start address. If "4X10" is set to "3", the transmission direction is opposite.

Likewise, the transmission operations in the other two directions are the same, and the only difference is that the data memory of the touch screen is changed to the local data register (LW).

Backlight Close

This function can be used for closing panel backlight with a bit register. When the specified Bit register state is ON, the backlight of the panel will be shut off. Even if the Bit register is set OFF, the backlight will not resume. To use a PLC Bit register to light up the backlight, use the **Backlight Open** function.

Backlight Close (return value)

This function is similar to the Backlight Close function we have just mentioned above. The only difference is that when selecting this type of Backlight Close, the control Bit will be automatically cleared after the backlight going off.

Backlight Open

This function can be used for opening panel backlight with a bit register. When the specified Bit register state is ON, the backlight of the panel will be turned on. Even if the Bit register is set OFF, the backlight will not go OFF. To use a PLC Bit register to shut off the backlight, use the **Backlight Close** function.

Backlight Open (return value)

This function is similar to the Backlight Open function we have just mentioned above. The only difference is that when selecting this type of Backlight Open, the control Bit will be automatically cleared after the backlight being turned on.

Screen Hardcopy

This operation is used to control the printout of the content of current screen by use of a bit address. If the bit register is triggered from "OFF" state to "ON" state, the current screen will be printed out. In the **[Print Settings]** interface that appears by selecting **[HMI]**/**[Properties]** in the

communication configuration interface, the valid printer type should be set. Please refer to the descriptions of "**Screen Hardcopy**" in Chapter 10.

Execute Macro Program

If the designated bit address state is "ON", the selected macro will be triggered.

PLC Contro	l					×
НМІ	нміо	HMIO -		PLC No.	0	•
Addr. Type	LB		•	Address	0	
Code Type	BIN		Ŧ	\Format:DE	0[1	
				🔲 Use Ad	dress Tag	
Control Type	E	Execut	e M	lacro Program	i	-
Macro Numb	er [macro_	0.c	•		
Open Add	dress T	ag Lal	brar	у ОК	Cano	el

eAddress Type/Address: The address of the register triggering the execution of the macro instruction. If this bit is set to "1", the macro code will be executed; if it is set to "0", the macro instruction will not be executed.

Macro No.: The number of the macro code to be executed.

Note: This function can be used only when macrocodes are added to the project. For the adding of macrocodes, please refer to Chapter 9.

6.37 About Overlapping of Components

The overlapping of multiple components will generate many special functions. The MT5000 can support the overlapping of multiple components. if these overlapping components are touched, the program will execute related operations according to layer order of the individual components. The components in the topmost layer are considered to be touched first and the corresponding function will be conducted first, and then the second layer, and so on. For example, If six bit state setting change components are overlapped to respectively control register Y0 (the topmost layer) to Y5 (the bottommost layer), when these components are touched, the MT5000 will execute the program in the following order:

First eset the ON/OFF of Y0, and set control the ON/OFF of Y1 (step 2), set the ON/OFF of Y2 (Step 3), and so on, and finally, set the ON/OFF of Y5 (step 6).

Please note that, when the MT5000 encounters the **Change Window** command, it will bypass the following components and directly change to the target window. As shown in the following figure, if Y2 is a function key for **Change Window**, Y3 ~Y5 will be neglected. The number of overlapped components should not exceed 32.

6.39 Notebook

Notebook Component is like the **Notebook Program** in the **Windows Operating System**. The user can input text contents in the component area. Operations such as Copy, Cut and Paste are supported. These functions are implemented by **Function Key** component.

The Notebook-Only functions of the Function Key are listed in the following figures:

Function Key Component Att	ribution X
Function Key Trigger Addr 1	Tag Graphics Position
C Switch Window Change -	0:Frame0 + C Excute Marco +
Keyboard Func. Cursor •	Move up C Map Keyboard
Mapping-Key Message Board C Tool Pen Pen Color C Pen Color C Pen Width C Clear	Move up Colo Move down Move left White Magn Indicator Line head Indicator Print Page Trend Graphics Current Horizontal Next Vertical
	确定

Figure 1 shows the functions related to move the cursor. There are eight functions: [Move up], [Move down], [Move left], [Move right], [Line head], [Line tail], [First Position] and [Last Position].

Move up: move the cursor up to the previous line, if the cursor is on the first line, it will remain in current position.

Move down: move the cursor down to the next line, if the cursor is on the last line of the **Notebook**, it will remain in current position.

Move left: move the cursor left by one character, if the cursor is on the head of a line, it will move to the end of the previous line. If it is on the head of the **Notebook**, it will remain in current position. **Move right**: move the cursor right by one character. If the cursor is on the end of a line, it will move to the head of the next line. If it is on the end of the **Notebook**, it will remain in current position.

Line head: move the cursor to the head of the current line. If it is on the head of the current line, it will stay there.

Line Tail: move the cursor to the end of the current line. If it is on the end of the current line, it will stay there.

First position: move the cursor to the first position of the **Notebook** component. If it is on the first position now, it will stay there.

Last position: move the cursor to the last position of the **Notebook** component. If it is on the last position now, it will stay there.

Note:

1. The Last position is the last position of the Notebook, not the last character of the current text content, in many cases, they are different.

2. To activate the cursor, touch the Notebook component on the panel to pop up the keyboard for input. The cursor will glitter to indicate the current position.

Function Key Component Attribution	×

The following figure shows a project screen using a textbook component.

Attributions of Textbook Component

The Textbook Component has some special attributions, as the following fugure shows:

Notepad Component	Attribution			X
Basic Attribution	Notepad Font	Trigger Address	Graphics Posi	tion
Total Lines				
Display Lines 4				
Words / Line 8				
				确定

Total Lines: The value indicates the total of lines of the Notebook component.

Display Lines: This value indicates the number of lines displayed on the screen; the user can use LW9170 to scroll pages if the Display Lines value is less than the Total Lines value. The value of the LW9170 register indicates which line is displayed as the first line in the textbook input area. By changing the value, the user can scroll pages of the textbook component.

Words/Line: Number of words per line, must be an even number. A word corresponds to two ASCII characters.

Chapter 7 System Parameters

The panel attributions must be properly set before it can work. In this chapter, we introduce the setting of the HMI attribution setting dialog box, including the setting of taskbar, extensional attribution, printer setting and serial ports setting. These parameters are required for correct PLC connection and other operations.

Double click HMI icon in the configuration project window to show the HMI attribution dialogbox.

HMI Attribution				×
Print Setting HMI	│ Serial Port 0 Se │ Task Bar	etting	Serial Port 1 HMI Extend Attrit	-

Description				
				ОК

In the dialog box, there are six tabs, namely, HMI, **Taskbar**, HMI **Extend Properties**, **Print Settings**, **COM1 Settings** and **COM0 Settings**, as detailed one by one below.

7.1 HMI

HMI Attribution		
Print Setting HMI	Serial Port 0 Setting Task Bar	Serial Port 1 Setting HMI Extend Attribution
Network Setting IP Address	168 . 0 . 253 Port Numb	er 2008
Display Setting Screen Display Mode	Horizontal C Vertical	
Description		
		ОК

IP Address: Set the IP address of the HMI. This IP address is the IP address of the HMI when

the Ethernet connection is used. (IP Address is only valid for MT5000 and MT4000E, not for MT4000)

Port Number: Refer to the description in Section 3.9.

Display Settings: Select the display mode: **Horizontal** or **Vertical**. The display mode is set when dragging and dropping the HMI icon. Once it is selected, it cannot switch over to the other mode. So this parameter is only for reference here.

Description: Description of the HMI, which will be displayed in the HMI description frame during download or simulation to help user distinguish different HMI panels.

7.2 Taskbar

Print Setting	1	Serial Port 0 Settin			g Serial Port 1 Setting

								0	к

Display taskbar: Determine whether to display the taskbar. If this check box is selected, the taskbar shown in the above figure will be displayed in the lowermost part of the screen.

Use touch lamp: When the screen is touched, the lamp will blink. If this check box is selected, the touch screen lamp will be displayed in the right part of the taskbar, as shown in the above figure. The touch lamp can blink different colors when you touch the three types of panel area: workspace area, un-workspace area and undefined area. The color will indicate which kinds of area you are touching, help you touch the correct position.

Include CPU lamp: The CPU lamp is a bar graph showing the percentage of CPU resources currently being used. If this check box is selected, the CPU lamp will be displayed in the right part of the taskbar, as shown in the above figure.

Include alarm lamp: Alarm lamp is a bar graph showing the percentage of the number of current alarms to the total number of alarms entered in the alarm message. If this check box is

selected, the alarm lamp will be displayed in the right part of the taskbar, as shown in the above figure.

Include fast selection window: Determine whether to include the fast selection window. If this check box is selected, the user can use the parts in the fast selection window to switch over between different windows. If this check box is not selected, the fast selection window will not appear.

Quicken pop-up of taskbar: Whether to quicken the pop-up speed of the taskbar.

Quicken fast selection window: Whether to quicken the pop-up speed of the fast selection window.

Background color: Select the background color of the taskbar from any of the following colors, or select**Custom** to configure your own color.

Undefined area color: When you touch an undefined touch area (that is, the area outside the valid touch area of the touchable parts, but still within the outline of the parts), the touch lamp will blink a color different from the color when touching the valid area of the touchable parts. The color for the non-effective touch is set here.

CPU lamp color: Set the color of the CPU lamp.

Alarm lamp color: Set the color of the alarm lamp.

Touch lamp frame color: Set touch lamp frame color.

Touch un-workspace area color: Displays the touch lamp color when touching a non-working area.

Touch workspace color: Displays the touch lamp color when touching a working area.

Hide fast selection window and Hide taskbar: The texts entered in these two boxes are the texts to be displayed in the Display/Hide Fast selection Window and Display/Hide Taskbar window.

Button Position: The position for fast selection window buttons and taskbar buttons is set here, only two options are provided: **aligning to the right** or **aligning to the left**. If the **Align Right** option is selected, the fast selection window buttons and taskbar buttons will be displayed in the lower-right corner of the screen; otherwise, they will be displayed in the lower-left corner.

Text Alignment: The alignment mode of the texts in the fast selection window buttons and taskbar buttons. You can enter a name in the fast selection window and taskbar, like "Start, Taskbar".

Button Area Size: Select the width and height of the button area.

Font Size: Select the font size of the labels of the fast selection window button and taskbar button.

7.3 HMI Extend Attributions

Fast-sel.Win.	Frame2	•				Cursor Co	olor 🔻
							ок

Screen Saver Time (Screen Protect): Indicates the time period after which the touch screen will enter the screen saver state if no touch operation is conducted during the period. (The time here is counted in minutes)

Text Library Languages: The number of languages included in the project, for example, English, Germany, French, and Chinese, or any other language. For details, refer to the description of text library in Chapter 6.

Default Language: The default language of the project when it is created.

Initial Macro: The number of the macro to be firstly run after the panel finishes power on and enter the application project.

Initial Window No: The number of the window to be displayed by the system firstly when the user power on the system and enters touch panel application program. The default initial window is window 0.

Note: The user can modify the **Initial Window No.** whenever it is necessary, open the project and change the initial window No. here and re-download the poject to the panel, the change will take effect. Another method for changing the initial window number is introduced in chapter 16.

Common Window No. (Public Window): The window number of the common window in the project, window 1 by default.

Fast Selection Window No.: The window number of the fast selection window in the project, window 2 by default.

Common (Public) window Attribution: Defines whether the common window of the project is displayed above or under the basic window.

Pop-up Window Attribution: Set whether the pop-up window is displayed normally (the pop-up window doesn't make a monopoly of the topmost layer and other windows can be switched to the upmost layer) or is always displayed in the topmost layer.

Upload Password: Upload password for programs. The password helps prohibit unauthorized person uploading the project file from the panel to PC and hence protects the intellectual property of the project designer and authorized users. The initial password is 888888 by default.

Level 0-2 Password: Security password. For details, refer to Chapter 12, "Security Level".

Save Event Log: Check this checkbox if you want to save the event log.

Initial Address: Indicates the start address from which event log will be saved, the event log is saved in the RW (Recipe Word) registers.

Record Count: Indicates the maximum number of events to be saved.

Enable Buzzer: Enables/disables the buzzer. If this check box is selected, the system will give a buzz sound when the panel is touched.

About the storage of Event Library

Initial Address: The address of recipe card where the storage space for event library begins.

If the [Save Event Log] option is selected in the [HMI Attribution] dialog box is checked, the system will automatically save the triggered event information in the recipe card. The user doesn' t need to care about the detail of saving event information. The saving procedure is automatically done by the system. The event library starts from the address specified in the [Initial Address] field. The default value is 0.

Data saved in the recipe card include Event Library Management Information and event entry information. The event library management information has 30 words and is saved from the [Initial Address]. The event entries are just saved after the management information. The length of an event entry is 20 words.

The following example will show the arrangement of memory space for event entry storage.

Open the [HMI Attribution] dialog box and select the check box [Save Event Log], as the following figure shows:

HMI Attribution	l					×	
Print Settin HMI	Print Setting		Serial Port 0 Setting Task Bar		Serial Port 1 Setting HMI Extend Attribution		
ScreenProtect	10		Public Win.Attrib	ution	Display below the basic windov	-	
TextLab Lan.	4	•	Pop Window Att	ribution	Display on the top layer	-	
Default Lan.	1	•	Upload Key	888888	🔽 Save Event Log		
🔲 Init.Macro		Ŧ	0 Level Key	888888	Init.Addr.		
Init.Window	Frame0	•	1 Level Key	111111	RecordN 0		
Public Window	Frame1	•	2 Level Key	222222	🔲 Use Buzzer		
Fast-sel.Win.	Frame2	•			Cursor Color	•	
					OK	=	
						_	

The system will reserve an area starting from RW100 for saving the event entry data. Suppose that we want to save an event entry management information and 200 event entries, as the following table shows:

Rcp. Card Addr.	Data			
RW100	Event list management Info			
RW130	Content of 1st event entry			
RW150	Content of 2nd event entry			
RW170	Content of 3rd event entry			
?????	????			
?????	?????			
RW4090	Content of 199th event			
	entry			
RW4110	Content of 200th event			
	entry			

The size of the reserved space is 200×20+30=4030 words. For users, this area cannot be written, any write operation will cause unpredictable results. The [Initial Address] can be designated by the user at his will. There are two notes on that address:

1. The desired memory area should not have any address conflict with the other registers in the project.

2. The end of the memory are should not exceed RW60000, spaces over RW60000 is reserved by the system.

7.4 Print Settings

Printer: Select the printer model.

Print No.: If this check box is selected, a serial number will be printed out with the event message. The serial number will be increased with each new event.

Print Time: If this check box is selected, the print time will be printed out with the event

message.

Print Extend Time: Determine whether to print out the time in the format of "day: hour: minute".

Print Date: Determine whether to print out the print date.

Print Extension Date: Determine whether to print out the date in the format of "YYYY-MM-DD".

Check Window Errors: Determine whether to check errors in the window during printing.

For detailed print settings and methods, refer to Chapter 10.

7.5 COM Settings

ŀ	MI Attributio	n				×
	HMI Frint Setting		Task Bar Serial Port 0 Setting	Attribution		
	Туре	RS232	•	PLC Communicatio	n Time Out	3
	Baud Rate	9600	-	Protocol Time Out	1	3
	Word Length	8	-	Protocol Time Out	3	
	Parity	none	-	Max interval of bloc	2	
	Stop Bit	1	•	Max interval of bloc	2	
	Slave No.	0		Max block packag	32	
				Max block packag	e size(BITS)	64
						OK

The MT5000/4000 series panels provide two serial ports, so the user has to configure COM0 and COM1 separately. The two serial ports can be used simultaneously, connecting with two PLCs. For communication with PLC, the two ports are identical. So we only introduce the setting of Port 1. Setting of Port 0 is the same.

Type: Select the communication mode of the touch panel and the PLC, including such options as RS232, RS485-2W and RS485-4W.

Baud Rate, Word Length, Parity and Stop Bits: Set the basic communication parameters matching the PLC.

Slave Station No.: In most cases, the touch panel is the master station and the PLC serves as the slave station, and this parameter is invalid then. When the touch panel serves as the slave station while the PLC serves as the master station, for example, selecting the MODBUS SLAVE protocol, set the slave station number for the panel here.

PLC Communication Timeout Time: This parameter determines the time used by the touch screen for waiting for the response of the PLC. When the delay for the communication between the PLC and the touch panel is longer than the timeout time, the touch panel will

display the message of "PLC NO RESPONSE". In general, this parameter is set automatically when the user selects a PLC model, so it is not necessary for the user to set it in most cases. **Protocol Timeout Time 1/2**: Communication protocol timeout time; in general, this parameter is set automatically when the user selects a PLC, so it is not necessary for the user to set it.

Max interval of block pack (WORDS), Max interval of block pack (BITS), Max block package size (WORDS), Max block package size (BITS): The touch panel HMI will automatically collect the PLC data with consecutive addresses and will send a singal read command to read such multi-addressed data, which greatly enhances communication efficiency and shortens response time. The parameters **Max block package size (WORDS)** and **Max block package size (BITS)** determine the maximum number of word and bit registers that can be read consecutively. The values are usually automatically set when the user selects a PLC, so it is not necessary for the user to set them.

If the addresses of such PLC data are not consecutive, the touch panel will read such data by separate commands, so a lot of read commands are required for reading such data. Therefore, we allow a user to modify the interval by modifying the parameters of **Max interval of block pack (WORDS)** and **Max interval of block pack (BITS)**. When the interval between two addresses is longer than the set value, they will be read as two packages; otherwise, they will be read as a package. In this way, it reduces communication packages and enhances communication speed.

An example:

As shown in the figure below, to read data from D20 to D29, when the PLC package is set to 0, the system has to use 3 read commands to read such data. When the **Max interval of block pack (WORDS)** is set to 1, the system can read such data with only one command. In general, the time used for reading additional two addresses (D23, D25) is far less than the time used for reading two packages, thus, communication time is saved.

D20 D21 D22	
D24 D25	
D27 D28 D29	

Note: Set the ports according to the physical connection. For example, if the PLC is going to be connected to COM1 in real application field, set the pramaters of COM1 in the **HMI** Attribution dialog box.

Chapter 8 Recipe Data

The recipe data transmission component can activate the data transmission of a consecutive register. It supports downloading data from the memory of the recipe card to the PLC, as well as uploading data from the PLC to the memory of the recipe card. The size of the transmission data can be set. For MT5000 HMI, a 256K-Byte memory card can be selected to store recipe data.For MT4000 HMI, the capacity of the recipe memory is 128K-byte.

8.1 Creating a Recipe Data Transmission Component

1. Press the recipe data transmission component icon Recipe Data, and the following window appears. Enter related contents in the [Basic Attribution] tab.

Recipe Component Attribution								×		
Basic Attribution Recipe Data Tag Graphics										
Priority

[Output Address]: Refers to the initial address of a consecutive PLC register, the word addresses designated by the [Data Length] after this address can be used to transmit data.

[Address]: Address corresponding to the recipe data transmission component.

[Code Type]: BCD or Binary.

[Word No.]: Depends on the number of data to be transferred later.

[Use Address Tag]: Whether to use the established address tag; for details refer to Section 6.35.

[Description]: Reference name assigned to the recipe data transmission component (do not display).

2. Click the [Recipe Data] tab and set the function and data length.

Recipe Component Attribution	X
Basic Attribution Recipe Data Tag Graphics	
Function Upload 🔻	
Data Length 6	
	ОК

[Function]:

Download: Transferring data from the recipe memory of the touch screen to the PLC.Upload: Transferring data from the PLC to the recipe memory of the touch screen.[Data Length]: The data to be transferred in the unit of words.

- 3. In the [Graphics] tab: Select vectograph or bitmap to display the component.
- 4. In the **[Tag]** tab: Enter the words to be displayed.
- 5. Click [OK], place the component and adjust its size.

8.2 Recipe Memory

The recipe memory is the SRAM with backup batteries. Therefore, the contents in the memory can be saved for at least half a year after power failure. When the system is powered on, the batteries will be automatically charged. The total size of the recipe memory is 64k words. The recipe memory has two expressions: "RW" indicates the absolute address, while "RWI" indicates the index address. "LW9000" indicates the offset of the index address. For example, if the LW9000 is 50, the index address RWI 0 will direct at the data of the address RW50. At this time, if we change the data of LW9000 to 51, the index address RWI 0 will direct at the data of the address RW51, as shown in the figure below:

Based on the above basic concepts, the following is an example: We designate a project and select the "MODBUS RTU" as the PLC type. The following section describes how to upload 5-word text data beginning from the slave address 200 and with the slave address type of 4x to the RW300 address of the recipe memory. The implementation process is shown as follows:

Address	Data
4x200	'A','B'
4x201	'C','D'
4x202	'E','F'
4x203	'G','H'
4x204	'l','J'

Before upload

 Address
 Data

 RW300
 'B','B'

 RW301
 'C','C'

 RW302
 'D','D'

 RW303
 'E','E'

 RW304
 'F','F'

After upload

Create a new project and select [MODBUS RTU] for the PLC type

Firstly, create a component for uploading recipe data: Set [Address Type] to 4x, [Address] to 200, [Function] to Upload, and [Data Length] to 5. Select the [Use Address Tag] check box. The label content is [Upload], as shown in the figures below:

Recipe Comp	ponent	At	tributio	n							×

Place it on the window:

RCP0 Up Load	

The recipe data transmission component is made, but it only indicates that the five words with the starting address of 4x200 shall be transferred to the recipe memory, and it does not suggest the specific position in the recipe memory. This is where the reserved keyword LW9000 of the system works. Set the value of LW9000 to 300 and press transmission component key. The five words with the starting address of 4x200 will be transferred to the position of five words with the starting address of 4x200 will be transferred to the position of five words with the starting address of 4x200 will be transferred to the position of five words with the starting address of 4x200 will be transfer the five words with the starting address of 4x200 in the recipe memory. To transfer the five words with the starting address of 4x200 to the position RWI00 in the recipe memory, set the value of LW9000 to 100 and press the transmission component key.

To complete the transmission, we have to make a text input component to modify the upload data. Set [Address Type] to 4x, [Address] to 200, and [Word No.] to 5. Set trigger address type to LB and address to 9000. It is shown in the following figure.

Text Input C						Y					×

Code Type	BIN	•	Forma	tDDDDDD	Code Type	BIN	Ŧ	Format:	DDDDD	
Word	5	•	🗖 Us	e Addr Tag	WordNo.		Ŧ	🔲 Use/	Addr Tag	
Description	TI1									
							_			
									()K

Place a keypad. The completed project is shown in the figure below:

AAAAA	100		U	pLos	1d		9000 ###]		
	1	2	3	4	5	6	7	8	9	0
	Q	M	Е	R	Т	Y	U	Ι	0	Р
	Ĥ	S	D	F	G	H	J	К	L	CLR
	Ζ	Х	С	Ų	В	Ν	M	BS	ESC	ent

Save and compile the project, run the project in the offline simulation mode. Firstly, change LW9000 to 300. Since LW9000 indicates the offset of the index address, RWI0 displays the data of RW300 address, as shown below:

RWIØ		1	1	1	L	490) (-	*	View
4X100] [UpL.o	ad					
1	2	3	4	5	6	7	8	9	0
Q	ш	Е	R	Т	Y	U	Ι	0	Р
A	S	D	F	G	Н	J	К	L	CLR
Ζ	х	С	Ų	В	Ν	M	BS	ESC	EM

Then, enter the text data "**QWERTYUIOP**" in the [**4x100**] text box and click the [**Upload**] key. The RWI0 displays the same data as the [**4x100**] text box. It indicates the uploading succeeds, as shown in the figure below:

									R	View
RWI QHEF 4X1 QHEF	<mark>ятті</mark> 00			UpL.o	ad		U90 30(
	1	2	3	4	5	6	7	8	9	0

Word 🖵 Use Addr Tag	WordNo. 1 - 🔽 Use Addr Tag
Description RCP0	
	OK

Recipe Compo	nent Attril	bution			X
Basic Attribution	Recipe Da	ta Tag	Graphics		
Function	Download	•			
Data Length	5				
					OK

The completed project is shown as follows:

Ru AAAAA 4X AAAAA	100	_	_	ownL	_		9000 ###)]		
	1	2	3	4	5	6	7	8	9	0
	Q	μ	Ε	R	Т	Y	U	Ι	0	Р
	A	S	D	F	G	Η	J	K	L	CLR
	Ζ	Х	С	Ų	В	Ν	M	BS	ESC	ENT

Run the project in offline simulation mode. Firstly, set the value of LW9000 to 300 and enter "AAAAAAAAA" in the RWI0 text box. The operating state is shown as follows:

RЫ <mark>АААА</mark> 4X1	haar	1AAA] 🖸	ownLo	ad		W90 30			
	101297			UpLos	d					
	1	2	3	4	5	6	7	8	9	0
	Q	ш	Е	R	Т	Y	U	Ι	0	Р
	A	S	D	F	G	H	J	к	L	CLR
	Z	х	С	U	В	М	м	BS	ESC	ENT

Click [Download]. The text data will be transferred from RW300 to 4x100.

RWI AAAA 4X1	AAAA	AAA] 🖸	ownl	oad		490) 300			
AAAA	AAAA	1AAA		UpLo	ad					
	1	2	3	4	5	6	7	8	9	0
	Q	W	Е	R	Т	Y	U	I	0	Р
	A	S	D	F	G	Η	J	к	L	CLF
	Ζ	х	С	V	В	Ν	М	BS	ESC	EN

In the above example, we find that whether uploading PLC data to the recipe memory or downloading data from recipe memory to the PLC, the starting position of the recipe memory data is the value corresponding to the LW9000 address. This is important for implementing some complicated recipe data functions. The section below gives a detailed description of the usage of the recipe memory data.

8.3 Uploading/Downloading of Recipe Data Between Touch Screen and PLC

Recipe data is very important. For example, in an industrial production line, the production equipment can fulfill different tasks according to different parameters. We can store a group of

data to the recipe memory in a defined format and revoke such data when necessary. In this way, we do not need to enter data temporarily, which greatly enhances production efficiency.

◆ The following example shows how to conveniently invoke multiple recipe data

Suppose we have ten groups of recipe data in total, each group consists of five words, among which recipe name occupies four words and recipe data occupies one word. We plan our recipes from RW0 as follows:

Rcp. Grps.	Reg. Addr.	Name of Rcp. (4 words)	Rcp. Data (1 word)
Group 0	RW0-RW4	"ΑΑΑΑΑΑΑ"	0
Group 1	RW5-RW9	"BBBBBBBB"	1111
Group 2	RW10-rw14	"CCCCCCC"	2222
Group 3	RW15-RW19	"DDDDDDDD"	3333
Group 4	RW20-RW24	"EEEEEEE"	4444
Group 5	RW25-RW29	"FFFFFFF"	5555
Group 6	RW30-RW34	"GGGGGGGG"	6666
Group 7	RW35-RW39	"ННННННН"	7777
Group 8	RW40-RW44	"	8888
Group 9	RW45-RW49		9999

It is expected that each group of recipe in the above figure can conveniently conduct data exchange with PLC equipment register 4x100 through project design. Firstly, let's take a look at a completed project shown in the figure below to gain an overall concept. In the project, RWI0 and RWI4 show the recipe data of group 0. Click [Download] to download the recipe data to 4x100. Click [Upload] to upload the 4x100 data to the recipe memory. Click the [Up] direction key on the right to query previous recipe data so that the user can modify and transfer recipe data; Click the [Down] direction key on the right to query next recipe data.

Recipe RWI0 KKKKKK 4X100	R (K 1)	Gro WI 4 <mark>234</mark> {104	Dow	ιu	0		Dat 9000 erla	"Su	btrac 10''S	:tion' :UB''
KKKKKK			243	load		1000000	9000 /erla			.DD"
	1	2	3	4	5	6	7	8	9	0
	Q	W	E	R	Т	Y	U	I	0	Р
	A	S	D	F	G	H	J	К	L	CLR
	Z	X	С	U	В	Ν	Μ	BS	ESC	ENT

This gives us a rough idea on the design purpose of the project. The following section will detail the preparation process of the project.

Firstly, create a new project and select [MODBUS RTU] for the [PLC Type]

Create a text input component to display and modify the each group of recipe name. Set the **[Word No.]** to 4.

Te	xt Input C	ompon	en	t Attrib	ution							×

In addition, we have to design two buttons to enable a user to query and modify each group of recipe data conveniently. One button is to query previous data, and the other is to query next data. The former is a multi-state setting component. Each time when you press this button, the system will deduct 5 from the value of LW9000 because each group of recipe data consists of five words. Press this button once, and the RWI0 can display the data of the previous recipe, as shown in the figure below:

		OK

The button for querying the next recipe is also a multi-state setting component. Each time when you press this button, the system will add 5 to the value of LW9000 because each group of recipe data consists of five words. Press this button once, and the RWI0 can display the data of the next recipe. The upper limit for this parameter is 45 (10 groups of recipes).

How to know which group the current recipe is? What controls the value displayed by LW0? We can make two more multi-state setting components, with the address of LW0 both. One is for deduction and the other is for addition, without the need of any shapes, as shown in the figures below:

Overlap the component whose [Setting Mode] is [Sub Value] on the multi-state component created earlier whose type is also deduction and whose address is LW9000. Overlap the

component whose [Setting Mode] is [Add Value] on the multi-state component created earlier whose type is also addition and whose address is LW9000. In this way, when we browse recipe data, the value of LW0 changes to indicate the group number of the current data.

Place a keypad on the window and make some text decoration, and the project is completed.

Recipe Card Group #### Recipe Data											
RWIØ	R	WI4	_			_1.1.6		220			
AAAAAAA	iA #	###	Dow	nloa	a 🕇				otrac 10"S	tion"	
4X100	4>	(104	Ļ							UB	
AAAAAAAA #### Upload UW9000"ADD"											
				_		li Uv	eria	Y LW	IO A	DD	
	1	2	3	4	5	6	7	8	9	0	
	Q	μ	Ε	R	Т	Y	U	Ι	0	Р	
	A	S	D	F	G	H	J	K	L	CLR	
	Ζ	Х	С	Ų	В	Ν	Μ	BS	ESC	ENT	

Save it to disk, compile it, and run the project in the offline simulation mode:

Recipe	Card	Gro	up	1) Re	cipe	Dat	a		
RWIØ	R	WI4				-1 LIQ	1000	"Sul	htrac	tion'
		0	Dow	nloa	4			y LW		
4X100	4)	(104	243			-1.0	9000)"AD	ייחו	
		0	Up	load	1			y LL		DD"
	1	2	3	4	5	6	7	8	9	0
	Q	ш	E	R	Т	Y	U	I	0	Р
	A	S	D	F	G	Н	J	ĸ	L	CLF
	Z	х	С	U	В	N	М	BS	ESC	ENT

Enter the above-mentioned ten groups of recipes into the recipe memory. Then, we turn to the group 8, change the recipe name to "KKKKKKK", change the data to 1234, and click [**Download**], as shown in the figure below:

Recipe RWI Ø <mark>KKKKKK</mark>	R	WI4	1	8 1 11 nloa		al 110	Dat:	"Su	btrac	tion"
4X100 <mark>KKKKK</mark> K	4>	(104		load		n L W	eria: 9000 veria)"A[)D"	:UB" .DD"
	1	2	3	4	5	6	7	8	9	0
	Q	ш	E	R	Т	Y	U	Ι	0	Р
	A	S	D	F	G	Н	J	К	L	CLR
	Z	х	С	U	В	Ν	М	BS	ESC	ENT

We can see that the data of 4x100 changes to "KKKKKKK", 1234. The change in the memory is shown as follows:

Rcp Grp	Reg. Addr.	Name of Rcp. (4 words)	Rcp. Data (1 word)]		
Group 0	RW0-RW4	"AAAAAAA"	0			
Group 1	RW5-RW9	"BBBBBBBB"	1111			
Group 2	RW10-rw14	"CCCCCCC"	2222			
Group 3	RW15-RW19	"DDDDDDDD"	3333			
Group 4	RW20-RW24	"EEEEEEE"	4444		Addr.	Data
Group 5	RW25-RW29	"FFFFFFF"	5555		4x100-4x103	"KKKKKKKK"
Group 6	RW30-RW34	"GGGGGGGG"	6666		4x104	1234
Group 7	RW35-RW39	"ННННННН"	7777			
Group 8	RW40-RW44	"KKKKKKKK"	1234			
Group 9	RW45-RW49	"1111111"	9999			

After learning the preparation process of this project, we should learn the basic project design of recipe data. The user can make full use of the diversified features of the EV5000 configuration software to produce better projects.

Chapter 9 Macro Code

Macro instructions are a kind of advanced touch screen control method which strengthens the functions of the touch screen. The touch screen will have the same logic and arithmetic operations as the PLC by the programming of macros. Flexibly use of macros will enable the touch screen to implement many powerful functions that cannot be supported by many regular components and to make your human-machine interfaces more perfect.

The EV5000 provides totally new macros different from the macro script language modes of other human machine interfaces. The macro is fully compatible with standard C language (ANSI C89). Since abundant documents and data on the C language are easily available, this chapter will not describe syntax and basic knowledge of the C language. Instead, it focuses on the creation and usage of macros through examples.

9.1 Getting started: A Simple Macro Template

The following section describes how to compile a simple macro template, and the macro template will implement the following simple operation functions:

Read two signed numbers, divide LW0 with LW1, and place the result of a double float in the four words of LW2~LW5.

Click the macro icon in the toolbar of the database or select the [Add Macrocode] command in the [File] menu.

The following dialog box appears.

Select an HMI number and enter a file name in the [File Name] text box. Click [Create] to enter the macro editing window, as shown below:

Before compiling macrocodes, define input and output variables.

Right click in the [Macrocode Variable Window], and the following menu appears:

Parameters							\times
Data type	Param name	PLC Station	Reg-Addre	Address	No of Word	OptMode	
		De	d Variable lete Variable dify Variable				
<							>

Select [Add Variable], and the following dialog box appears:

Macro Code	Variable				×
Variable	Param		нмі	HMIO	-
Data Type	bit	•	PLC No.	0	•
R	Read	•	Address Type	0×	•
Word Length	1		Address For	mat:DDDD	
			Coding Type	BIN	-
	OK		Cancel		

Firstly, assign a name to the variable:

Variables are divided into two types: Reading variables and Writing variables. They are distinguished from each other by read/write attributes. Reading variable means the macro code will obtain the value of the variable from a designated address, while writing variable means writing an operating result from the execution of macrocode into a designated address. Therefore, read/write variables are different variables for the same address. Therefore, it is recommended that _R and _W be used to distinguish them when naming a variable.

In this example, LW0 and LW1 are reading variables and LW2 is a writing variable. Therefore, we name them as follows: LW0_R, LW1_R, LW2_W. Please note that the variable name shall comply with the requirements of C language for variables. Particular attention shall be paid to the following points:

- 1. Variable name is case sensitive.
- 2. Variable name cannot be a number, or started with a digit, or contains special characters like blank and backslash.
- 3. Variable name cannot be any reserved keyword of C language.

In the above example, set the properties of the LW0_R as follows:

Lacro Cod	le Variabl	Le			×
Variable	LWO_R		ниі	HMIO	-
Data Type	signed she	•	PLC No.	0	•
Address	LW	•	Address	0	
Word Length	1		Format:DDDD)	D	
R/W	Read	•	Code Type	BIN	•
	OK		Cancel		

In the window, select "**signed short**" for **Data Type**, **R** for **R/W**, "**LW**" for **Address Type**, and "**0**" for **Address**. Click **OK**, and the variable is registered in the **Macrocode Variable Window**.

Parameters						×
Data type	Param name	PLC Station	Reg-Addre	Address	No of Word	OptMode
signed short	LW0_R	0	LW	0	1	Read

 \wedge

Note: While compiling macrocodes, all referenced external data must be registered in the **Macrocode Variable Window** in advance.

Use the same method to set LW1_R and set the address to LW1. The properties of LW2_W are set as follows:

Macro Code	Variable				×
Variable	LW2_W		НМІ	нміо	-
Data Type	double	•	PLC No.	0	-
R	Write	•	Address Type	LW	-
Word Length	4		Address For	2	
			Coding Type	BIN	-
	OK		Cancel		

Caution: Select "double" for **Data Type**, and the **Word Length** changes to "4" automatically, that is, the variable occupies LW2~LW5.

After setting, the variable window is shown as follows:

Parameters						>	×
Data type	Param name	PLC Station	Reg-Addre	Address	No of Word	OptMode	
signed short	LW0_R	0	LW	0	1	Read	
signed short	LW1_R	0	LW	1	1	Read	
double	LW2_W	0	LW	2	4	Write	

After defining the variable, compile the codes as follows:

```
int MacroEntry()
{
//LW0 divided by LW1, is LW2
LW2_W=LW0_R/LW1_R;
return 0;
```

}

Save it to disk, and the compilation of the macro is completed. The system returns to configuration editing window. Edit the following parameters:

Place two numeric input components, corresponding to LW0 and LW1 respectively;

Place a static text and enter "/" to indicate a division operation;

Place a numeric display component, corresponding to LW2. Select "**Double**" for **Data Type** (. Both integer place and decimal place are 4;

Place a function key, execute the macro, and select "**macro_0.c**" in the drop-down list box, and enter "=" in the (**Tag**) tab, as shown below:

Function Key Component Att	ribution
Function Key Trigger Addr Tag	Graphics Position
C Switch Window Change	O:Frame0 O Excute Marco macro_0.c
C Keyboard Func. Enter Mapping-Key C Message Board	C Map Keyboard Print Color Black and White Text Multicolor Text
C Tool Pen * C Pen Color Color * C Pen Width 1 * C Clear	Magnify Multiple 1.0 Indicator Print Page © Current © Horizontal © Next © Vertical Indicator Indicator Indicator Indicator All Bitmap All VectorGraph Background
	ОК

The configuration window is shown as follows:

NIO		NI1	FK0	
####	1	####	=	ND0 ####.####

Perform offline simulation and enter "**5**" and "**2**" in LW0 and Lw1 respectively, and press "=" to obtain the result as follows:

According to our estimation, the result shall be 2.5 instead of 2. What is the problem? If the user is familiar with the C language, he will be aware of the reason quickly. Because the data type for LW0_R and LW1_R is "**short**", according to the default type conversion principle of C language, the division result will be rounded off to an integer. How to solve the problem? It is simple: just convert an input value into the type of "**double**":

LW2_W= (double)(LW0_R) / LW1_R;

5 ∕ 2 = 2.5000 Menu isk Bar (T) P A

After modifying the macro, conduct simulation again, and the result will be:

This simple example is complete. However, this segment of codes still has a problem: What if the LW1 input is 0? We all know the number 0 cannot be a divisor. In the C language, if a number is divided by 0 in an operation, it will cause the error of "division by zero overflow". In severe circumstance, it may lead to program deadlock or exit. The macro will encounter the error of "division by zero overflow" and affect normal operation of the system. What shall we do then? We have to check the operand.

Modify the codes as follows:

```
int MacroEntry()
{
    //Judge whether LW1 is 0, preventing division by zero overflow:
    if ( LW1_R != 0)
        //LW0 divided by LW1, is LW2
        LW2_W=(double)(LW0_R)/LW1_R;
return 0;
```

}

Run the macro again. If the divisor is 0, the macro will not conduct the division operation, thus enhancing the robustness of the codes.

9.2 Operating Principles of Macro Template ad Read/Write Variable

As shown in the above section, you may gain a preliminary understanding of the creation and use of the macro template. In this section, we will introduce the operating principles of the macro template and the precautions in the use of the macro template.

A macro template can be regarded as a black box with input and output. Taking the example in the section 9.1 for example, the model is as follows:

The execution principle is as follows: Before the module executes the macro, it obtains register values of LW0 and LW1 and assigns them to the read variables LW0_R and LW1_R, and then runs the macro template. After the macro function is returned, it will write the variable value of LW2_W to LW2.

Therefore, macro template inner variable is only a copy of the register. Modification of the variable value does not mean modification of register value.

- The macro template does not read register value in real time; instead, it reads the value at the beginning of the macro template operation. Therefore, during the operation of the macro template, changing the register value externally does not affect the operation results of the macro template.
- 2. The value of the macro template is not written in real time. Therefore, the variable value assigned during the operation of the macro template will be written into the macro template only when the operation comes to an end.
- 3. The read variable is read-only and the write variable is write-only. Therefore, assigning value for read variable or reading the value of write variable by macrocode is invalid operation. Likewise, if an address has to perform read and write operations, it must correspond to two different variable names, for example, LW0 corresponds to LW0_R and LW0_W.
- 4. A macro template can define temporary variables or arrays or even complex associations. However, it cannot set global variables or static variables. To use a global variable to save data, it is necessary to use a local address like LW, LB, and so on.
- 5. The register served as output must be assigned a value.

A Note:

1. Modify or delete variables in the macros

In the [**Project File Window**], find the corresponding macro and enter the macro variable window. Select a data type, right click, and then select to add, delete or modify the variable.

Project files window	×
🖃 🛅 test-071116	
😑 🛅 HMI	
🖻 🔂 HMIO.whe	
📲 macro_0.c	
😟 🛅 Vector Graph	
Double click enters "Macroco	de"
window!	

A deleted variable cannot be recovered, so be cautious on this operation.

2. Deleting a complete macro file

In the [Project File Window], select a corresponding macro and click [Delete].

A deleted macro file cannot be recovered, so be cautious on this operation.

9.3 Triggering of Macro

In the EV5000, macros can be triggered flexibly in multiple modes. Flexible use of macro triggering modes can conveniently implement more flexible and powerful functions. Presently, the EV5000 supports the following macro triggering modes:

1. System initialization macro:

Select the [Initialization Macro] check box in the [HMI Attribution] tab shown in the following window. The initialization macro will be triggered upon system startup to implement such functions as setting initial values of registers and transferring recipes.

Print Setting		Serial Port 0 S	etting	Serial Port 1 Setting			
HMI			Task Bar		HMLEX	tend Attributio	on
ScreenProtect 10		Public Win.Attrib	ution	Display below the basic windov			
TextLab Lan.	4	•	Pop Window Att	ribution	Display on the top layer		-
Default Lan.	1	•	Upload Key	888888		🗆 Save Ev	ent Log
💌 Init.Macro		•	0 Level Key	888888		Init.Addr.	0
Init.Window	macro_0.c	•	1 Level Key	888888		RecordN	0
Public Window	Frame1	•	2 Level Key	888888		🔲 Use Buz	zer
Fast-sel.Win.	Frame2	•				Curso	r Color 🔻

2. Function key triggered macro:

Use the "Execute Macrocode" function of the function key to trigger macros, which is a

common triggering mode.

3. Timer triggered macro:

Use the "**Execute Macrocode**" function of the timer to trigger macros. The macro can be combined with the timer trigger to implement multiple triggering modes of register triggering, timing triggering, and window initialization triggering.

4. PLC control macro

Set the PLC control component as shown below. Select the "**Execute Macro Instruction**" option. In this way, a segment of macrocodes can be executed when a PLC register is set to 1.

PLC Contro	l					
НМІ	нмі	0	•	PLC No.	0	-
Addr. Type	۵X		-	Address	0

9.4 Examples

The following sections will present a further explanation on macros with several interesting

examples.

Example 1: Touch Screen Bouncing Ball

In this example, it uses macros to implement the moving of a ball in a display area. The ball will be bounced back when it touches the border of the display area. The moving speed of the ball can be adjusted. (Note: The data in this example is applicable to 5300L/S/T projects. In case of 5400 or 5500, enlarge the size to 640×480.)

Firstly, add a vectogram BALL.VG and draw a "bouncing ball" with a round shape. If you have a more vivid picture, just import it.

Place a moving part in the upper-left corner of the screen; set the address to LW0 and select "move along X and Y axes", with the maximum value of 320 and the minimum value of 0; select the vectogram BALL.VG;

Place two value setting components and select to set them when the window is open; set LW3 and LW4 to 5;

Place four state setting components used to increase/decrease the value of LW3 and LW4. The planned register space is as follows:

LW0: State of the moving shape component, always 1;

LW1: Displacement of the moving shape along X axis

LW2: Displacement of the moving shape along Y axis

LW3: Moving speed along X axis

LW4: Moving speed along Y axis

Creating a macro:

Define the following variables as shown in the figure below:

Parameters						
Data type	Param name	PLC Station	Reg-Addre	Address	No of Word	OptMode
signed short	lw1_r	0	LW	1	1	Read
signed short	lw1_w	0	LW	1	1	Write
signed short	lw2_r	0	LW	2	1	Read
signed short	lw2_w	0	LW	2	1	Write
bit	direction_x_r	0	LB	0	1	Read
bit	direction_x_w	0	LB	0	1	Write
bit	direction_y_r	0	LB	1	1	Read
bit	direction_y_w	0	LB	1	1	Write
signed short	speed_x	0	LW	3	1	Read
signed short	speed_y	0	LW	4	1	Read

Compile the following codes:

#define MAX_X 260	//Maximum displacement along X axis
#define MAX_Y 180	// Maximum displacement along Y axis
#define MIN_X 0	// Minimum displacement along X axis
#define MIN_Y 0	// Minimum displacement along Y axis

```
int MacroEntry()
{
//direction: 0-increase, 1--decrease
if(direction_x_r)
   {//decrease
   lw1_w = lw1_r - speed_x;
   if(lw1_r < MIN_X)
       {
       lw1_w = MIN_X; //Prevent "out-of-bounds"
       direction_x_w = 0; //Change direction
       }
   }
else
   {//increase
   lw1_w = lw1_r + speed_x;
   if(lw1_r > MAX_X)
        {
       lw1_w = MAX_X;
        direction_x_w = 1;
       }
   }
if(direction_y_r)
   {//decrease
   lw2_w = lw2_r - speed_y;
   if(lw2_r < MIN_Y)
       {
       lw2_w = MIN_Y;
       direction_y_w=0;
       }
   }
else
   {
   lw2_w = lw2_r + speed_y;
   if(lw2_r > MAX_Y)
        {
       lw2_w = MAX_Y;
```

```
direction_y_w = 1;
}
} return 0;
}
```

Finally, add a timer component as set below:

ner Timer Functio	n				
Basic Attribution —			C Trigger Address-		
Trigger Mode 🛛 🗛	time	•	НМІ	HMIO	-
Exe.Cycle(100ms)	1		PLC No.	0	Ŧ
Response Mode	Immediate	•	Address Type	LB	-
Response State	Off	•	Address	0	
Repeat Times	0				

Select "Execute Macrocode" in the [Timer Function] tab and then select the compiled macrocode.

Upon completion, the configuration interface is shown as follows:

Run the macro and perform offline simulation. The ball moves in the screen. Adjust the speed at different directions and its moving track and speed change.

We can see from this example that, to implement continuous change of a certain register, the repeat revocation of macro instructions must be used and the input and write variables for the register to be operated must be defined.

Example 2: Domino

In this example, use a macro template to trigger the next macro template to implement a sequential operation. In this way, a sequence of "dominoes" will be fallen down or erected in

sequence. Firstly, draw a shape of a domino, that is, vectogram in two states: one vertical rectangle and one horizontal rectangle, and name the shape as BRICK.VG, as shown below:

Make six lamp components, with their addresses as LB1~6 respectively. Use the vectogram BRICK.VG. The configuration is shown in the figure below:

BL0	BL1	BL2	BL3	BL4	BL5	
- Do					-	

Make six timer components to be triggered by registers, with the triggering addresses as LB100~LB105 respectively. Taking LB100 for example, the timer setting is as follows: Select " Triggered by register state " for [rigger Mode], ON for [Response State], and "Execute immediately" for [Response Mode], and 1 for [Repeat Times]. Since it is triggered once and immediately, it is not necessary to pay attention to execution cycle.

Timer Compone	nt Attribution					×
Timer Timer Fu	nction					
- Basic Attributio	n		Trigger Address-			
Trigger Mode	By reg-address	•	НМІ	HMIO	•	
Exe.Cycle(100m	ns) 30		PLC No.	0	Ŧ	
Response Mod	e Immediate	•	Address Type	LB	Ŧ	
Response State	e On	-	Address	100		
Repeat Times	1					
					(эк

Then, we make six macro templates, which are to be triggered by the above-mentioned six timer

components in sequence. LB100 triggered timer corresponds to macro_0.c, LB101 triggered timer corresponds to macro_1.c, and so on.

The codes of macro_0.C are to change the state of the first domino. The codes are as follows:

```
int MacroEntry()
   LB1_W = !(LB1_R);
   LB101_W = 1;
   return 0;
```

The variable is defined as follows:

{

}

Parameters						
Data type	Param name	PLC Station	Reg-Addre	Address	No of Word	OptMode
bit	LB101_W	0	LB	101	1	Write
bit	LB1_W	0	LB	1	1	Write
bit	LB1_R	0	LB	1	1	Read

When macro_0 is triggered, it will change the state of LB1 and set LB101 to 1, which will then triggers macro 1. The macro 1 will change LB2 and set LB102 to 1. macro 2 ~ macro4 will be set in a similar way.

Macro_5 is different. Its codes are as follows:

```
int MacroEntry()
{
     LB6_W =!(LB6_R);
     LB100_W=1;
     return 0;
```

}

That is, macro_5 will trigger macro_0.

Make a bit setting component and set LB100 to ON. Change the label to [START] to trigger the first timer.

The edited configuration window is shown below:

Perform simulated operation and click [**START**]. The dominos will fall down one by one from left to right, and then will erect one by one from right to left. The speed is quick without intervals. In the [**Timer**] tab, select "**Delay**" for [**Response Mode**], and **10** for [**Execution Cycle**], as shown below:

Timer Compone	nt Attribution					×
Timer Timer Fur	nction					
Basic Attributio	n		Trigger Address-			
Trigger Mode	By reg-address	-	НМІ	HMI0	•	
Exe.Cycle(100m	s) 10		PLC No.	0	Ŧ	
Response Mode	e Delay	-	Address Type	LB	Ŧ	
Response State	On	•	Address	100		
Repeat Times	1					
						эк

Compile the codes and run the macros again. We can see that the dominos will be fallen down or erected after a delay of 1 second.

We can see from the above example that the timer triggered macros can be used to conduct sequential operations to implement sequence and time control and to flexibly achieve desirable results.

Chapter 10 Print

The print function is often used in the eView MT5000/4000. In this document, there are two types of print operations: One is the print through the Windows system, and the other is the print through the touch screen. This chapter describes only the print with the touch screen. To use the print function with the touch screen, it is necessary to enable the printer in the **Print Settings** tab in the **HMI Properties** window. After that, the MT5000/4000 will display a dedicated print window (therefore, if the print function is selected, a maximum of five pop-up windows can be displayed at the same time). You can view the print window in the PLC Monitor of the online simulation, offline simulation, and indirect online simulation auxiliary functions, as shown below:

HMI Attribution		X
HMI Print Setting	Task Bar Serial Port 0 Setting	HMI Extend Attribution Serial Port 1 Setting

		ОК

MT5000/4000 supports the connection with EPSON ESC/P2 printers or other compatible printers. MT5000/4000 supports the following print modes:

- 1. Print text
- 2. Print pointer
- 3. Print trend graph
- 4. Print all bitmaps
- 5. Print all vectograms
- 6. Print background color

The print function may be used in the following circumstances: Function key, screen printout and report output controlled by PLC, and event print, as detailed below.

10.1 Function Key

Click the [Function Key] and the following window appears. In the window, select the Print option.

Function Key Component Attril	bution	×
Function Key Trigger Addr Tag	Graphics Position	1
C Switch Window Change -	0:Frame0 C Excute Marco macro_0.c a C Map Keyboard	
Mapping-Key C Message Board C Tool Pen C Pen Color C Pen Width C Clear	Print Color Black and White Magnify Multiple 1.0 Print Page Current Horizontal Next Vertical Text Text Text Indicator Ind	
	OK	

(Printer Color) :

The user can select (Mono) or (Color).

(Zoom): The value range is 1.0~ 2.0.

(Page Range):

(Current Page/Next Page): Select the page to be printed.

(Landscape/Portrait): Select the print mode.

(Print Content):

- 1. (Print text)
- 2. (Print meter)
- 3. (Print trend graph)
- 4. (Print all bitmaps)
- 5. (Print all vectograms)
- 6. (Print background color)

Caution: When you select the (**Next Page**) option in the (**Page Range**) frame, the printer will skip the current page and start printing from the next page.

The print function key can be used to print screen data conveniently. The data is outputted from the standard printer port as graphics.

10.2 Screen Printout

The background component (**PLC Control**) \rightarrow (**Screen Printout**) uses a bit address to control the printout of the current screen. The printout of the current screen starts when the bit address changes from **OFF** to **ON**.

PLC Contro	at					
НМІ	нміо	•	PLC No.	0	-	
Addr. Type	LB	•	Address	0		
Code Type	BIN	Ŧ	VFormat:DI	DI 1		
			🗖 Use Ad	ldress Taj	9	
Control Type	Scr	en Har	d Copy			
Macro Num	per		+			
Open Ad	dress Tag	Labrar	у ОК	Ca	ancel	

As shown in the above figure, if LB0 is set to control the (**Screen Printout**) operation, when LB0 changes from **OFF** to **ON**, the current screen will be printed out. Upon the completion of printout, the LB0 automatically returns to **OFF**.

The print format is controlled by LW9054. When the LW9054 are the following numbers, it will perform corresponding print operations.

- 0. Print text
- 1. Print meter
- 2. Print trend graph
- 3. Print all bitmaps
- 4. Print all vectograms
- 5. Print background color

10.3 Report Output

The background component (**PLC Control**) \rightarrow (**Report Output**) uses a word address to control the printout of a designated window. The printout of the screen starts when the entered value of the word address is a valid window number. Upon the completion of printout, the value of the word address changes to **0**.

PLC Contro	il –					
НМІ	нміо	-	PLC No.	0	-	
Addr. Type	LW	-	Address	0		
Code Type	BIN	-	VFormat:D	DI		
			🗖 Use Ad	ddress Ta	g	
Control Type	Rep	oort Prin	ntout		-	
Macro Numb	ber					
Open Ad	dress Tag	Labrar	у ОК	C	ancel	

As shown in the above figure, if the value of LW0 is set to 4, the contents in window 4 will be printed out. Upon the completion of printout, the LW0 automatically returns to **0**. To print out a window by the (**Report Output**) function, the system will not switch to the window to be printed. The print format is also controlled by LW9054. For control functions, refer to the description given earlier in this document.

10.4 Event Printout

When the user enters events in the (**Event Entry**) background component, the user can set trigger printing. The corresponding contents will be printed out when the set condition is triggered.

E	vent			X
	- Address HMI	HMIO	•	Trig Function
	PLC No.	0	•	Pop Window 0:Frame0 +
	Data Type	Bit	-	🗖 Write Data 0 🗸

	📕 Use Address Tag		Tag	Text
	Attribution Event Trigging O On O Off			
	Cond. Cond. Print On Trig.			Font 16 Text Color Text Color
	Open Text Library Open A			en Address Tag Labrary Ok Cancel

If the [Bit] option is selected in the (Data Type) drop-down list box, as shown in the above figure,

and when the (**Print when triggered**) check box is selected, the system will print out the contents when the LB0 changes to **ON**. When the (**Print when resumed**) check box is selected, the system will print out the contents when LB0 returns to **OFF**.

If the [Word] option is selected in the (Data Type) drop-down list box, the following window appears.

E	vent			X
	- Address HMI	HMIO	•	Trig Function
	PLC No.	0	•	Pop Window 0:Frame0 -
	Data Type	Word	•	🖵 Write Data 0 🗸
	Add. Type	LW	•	HMI HM - PLC No. 0 -
	Address	0		Addr.Type LB - Address 0

	🗖 Re	turn to Norm	al	Use Text Library
	Open Text Library Open Address Tag Labrary Ok Cancel			

When the (**Print when triggered**) check box is selected, the system will print out the contents when the value of LW0 is less than 0. When the (**Print when resumed**) check box is selected, the system will print out the contents when LB0 resumes normal (that is, greater than or equal to 0).

10.5 Printing Failure

Printing error detection function is provided in the (HMI Properties) window.

HMI Attribution		
HMI Print Setting Print Fetting Print NEpson Stylus Print NEpson Stylus Print Til Print Til Print Extend Time(d:r Print Date Print Extend Date(yyy Check Window Error	116PH C65 05KT :m) y-mm-dd)	HMI Extend Attribution
		ОК

When the printer encounters an error, the following dialog box appears.

When the printer has an error, set LB9016 to **ON**.

The LB9017 can control the on/off status of the printer. When the LB9017 is set to ON, the printer will be disabled.

Chapter 11 Reserved Register Addresses of the System

The system reserves some areas of Local Word (LW), Local Bit (LB) and Recipe Word (RW) for special purposes. The user must use these addresses according to related description.

- Local Bit(LB): Reserved range: LB9000~9999
- Local Word(LW): Reserved range: LW9000~9999
- Nonvolatile Local Word: Reserved range: LW10000~10256

11.1 Local Bit (LB) registers reserved

Note: The letter R and W indicates the available operation for the address; R means readable and W means writable. So a register with the mark (R/W) can be read and write.

Address	Description	Remark
9000~9009	Set ON during	These bits can be used to initialize some components to be
	initialization	ON upon system startup (R/W)
9010	Recipe download	The bit address can be used to indicate the download
	indication	progress of the recipe. In the process of download, it is set
		to ON ; upon completion of download, it is set to OFF (R)
9011	Recipe upload	The bit address can be used to indicate the upload progress
	indication	of the recipe. In the process of upload, it is set to ON ; upon
		completion of upload, it is set to OFF (R)
9012	Recipe	These bit addresses can be used to indicate the
	download/upload	download/upload progress of the recipe. (R)
	indication	
9013	Touch screen	Set it to ON when touching the Touch Screen Indicator (R)
	indicator	
9014	CPU indicator	Set it to ON when touching the CPU Indicator (R)
9015	Alarm indicator 灯	Set it to ON when touching the Alarm Indicator (R)
9016	Printer error	It is set to ON in case of a print error and to OFF if printing is
	indication	normal (R)
9017	Printer control	To disable the print function, set it to ON ; to enable the print
		function, set it to OFF (In the system parameters, all printing
		options must be set to ON first; otherwise, this bit address is
		invalid) (R/W)
9018	Enter screen saver	When the system enters screen saver (backlight and
	status	energy saving), the bit is automatically set to 1; when the
		system exits the screen saver, it is set to 0.
9019	Exit screen saver	When the system exits screen saver (backlight and energy
	status	saving), the bit is automatically set to 1; when the system

		enters the screen saver, it is set to 0.
9020	Brush (it is set to ON	Message board function, determines whether the brush is
	when the brush is	currently selected (R/W)
	selected)	
9021	Eraser (it is set to	Message board function, determines whether the eraser is
	ON when the eraser	currently selected (R/W)
	is selected)	
9022	Block Cleanout ((it is	Message board function, determines whether the clearing
	set to ON in the	area function is currently selected (R/W)
	clearing area status)	
9030	Brush width is 1	Message board function, set brush width to 1 pixel when the
	pixel	bit is set ON(R/W)
9031	Brush width is 2	Message board function, set brush width to 2 pixels when
	pixels	the bit is set ON(R/W)
9032	Brush width is 3	Message board function, set brush width to 3 pixels when
	pixels	the bit is set ON(R/W)
9040	Hide/display Fast	Hide the Fast Selection Window if it is set to ON and display
	Selection Window	the Fast Selection Window if it is set to OFF (R/W).
9041	Hide/display taskbar	Hide the taskbar if it is set to ON and display the taskbar if it
		is set to OFF (R/W).
9042	Hide/display task	Hide the task buttons if it is set to ON and display the task
	buttons	buttons if it is set to OFF (R/W).
9043	Hide/display all	Hide the Fast Selection Window, taskbar and task buttons if
	(Fast Selection	it is set to ON , and display all these contents when it is set
	Window, taskbar,	to OFF (R/W).
	task buttons)	
9044	Save	When it is set to ON, the system will write communications
	communication	parameters saved in the LW10000 area back to the
	settings to the	E^2PROM on the panel mainboard. The parameters will be
	system	available in the next startup only when they have been
		written back to the E ² PROM.
9045	Restart touch screen	The panel will be restarted when this bit is set to ${f ON}$ (W)
9046	Low security level	It is set to ON when the system switches from a lower
		security level to a higher one (R)
9050	Restore factory	When the bit is set to ON, the system will save the default
	settings	global parameters in the downloaded data files to the
		LW10000 system parameter area. Upon successful
		execution, the system will automatically clear the bit.

9051	Enable/disable	Set this bit ON will disable the touch function when the
	touch function when	backlight is off. (R/W)
	backlight is disabled	
9052	Disable the return	To disable the value return function of the PLC, set this bit
	value function of	to ON, but it is applicable only to the return value control in
	PLC Control→	PLC Control→ Change Base Window. When the value of
	Change Basic	the LB9052 is OFF, and the return value function is not
	Window	disabled, to switch from Base Window 10 to Base Window
		12 with the PLC Control→ Change Base Window
		function (read address is D20), this switchover can be
		implemented only when the value of D20 is 12. After the
		system switches to Base Window 12, the PLC will
		automatically return the number 12 to the word address
		D21. If the return value function is disabled, the system will
		not return the number 12 to D21 (R/W).
9055	Disconnect: PLC	Clear this bit will make all commands for writing into the
		PLC invalid. When this bit is set ON, all writing operations
		can be performed. It serves as a logic switch for connecting
		and disconnecting the panel with PLC.
9056	Disconnect: Touch	Clear this bit will enable the touch function. When this bit is
		set ON, the touch function is diabled and it would not
		respond to any touch operation. It serves as a logic switch
		for the touch function.
9060	Keypad control bit,	When a user enables the numeric input or text input
	the pop-up of the	function, the MT5000/4000 set this bit to ON , and the direct
	keypad is controlled	window including a keypad will appear. After successful
	by the component in	entry or pressing [ESC], this bit will be set to OFF . The user
	the left part of the	can use this bit to control the keypad. After successful entry
	window	or cancellation, the keypad window will close automatically
		(For details of the keypad control bit, refer to the notes
		following the table) (R).
9061	Keypad control bit,	For usage of LB9060~LB9069, LB9080 and LB9081, refer
	the pop-up of the	to the notes following the table) (R).

	method in the case	Pinyin input method; when the value is 0, the system
	of Pinyin input	switches to English input method.
	method	
L		

Keypad control bit:

The whole screen of the MT5000/4000 is divided into four equal parts, as shown below:

When LB9060 is used to control the keypad and if text input or numeric input in the left part of the screen is triggered, the keypad will appear in a direct window. In general, the direct window is designed to appear in the right part of the screen, so it will not overlap the input component in the left. Likewise, when LB9080 is selected and the text input or numeric input in the upper part of the screen is triggered, the direct window including the designated keypad will appear.

Address	Description	Remark
9000~9001	Recipe data index	RWI and RBI use this two words to store index address
	address (R/W)	for accessing recipe data; the lower word is 9000 and
		the higher word is 9001. (R/W)
9002~9003	upper limit of the	It indicates the maximum input value when the numeric
	numeric input part	input is activated; it is set to 0 when the numeric input is
		not activated. (R)
9004~9005	lower limit of the	It indicates the minimum input value when the numeric
	numeric input part	input is activated; it is set to 0 when the numeric input is
		not activated. (R)
9006	Message board	Message board function, select current operation tool on
	operation mode	the message board:
		0: Brush, 1: Eraser, 2: Block Cleanout (R)
9007	Brush definition	Message board function, select the width for the brush:
		0: 1 pixel; 1: 2 pixels; 2: 3 pixels (R)
9008	Brush color (0~255	Message board function; the user can select any color
	corresponding to	among 256 colors by entering a number (R)
	256-color standard	
	color palette)	

11.2 Local Word (LW) registers reserved

9020	Interference	When the lower byte of this LW register is not zero, the
		value will be sent as an INT byte in MEMORY_LINK
		protocol (value range 0x20-0xFE), after successful
		sending, the byte will be cleared to 0.
9034~9035	System time (in the	Double word. Displays the time in the unit of 0.1 second
	unit of 0.1 second)	(R)
9040~9041	Security level	Double word. Refer to related part in Chapter 12,
	password	Security Level. (W)
9042	Security level	Display the security level of the current Base Window.
		Refer to related part in Chapter 12, Security Level. (R)
9043	Forced switchover of	Forced switchover from a higher level (for example, level
	security level	2) to a lower level (for example, level 0). Refer to related
		part in Chapter 12, Security Level. (W)
9050	Base Window number	Number of base windows of the touch screen are saved
		here. The salve machine can maintain the same base
		window with the master machine according to the word
		(using PLC control component) (R)
9054	Report output format	0: Text & meter & trend graph, 1: Text & meter & trend
		graph & vectogram, excluding templates, 2: Text & meter
		& trend graph & bitmaps, 3: Text & meter & trend graph
		& bitmaps & vectograms, excluding templates, 4: All
		(R/W)
9057	Size of each item in	Size used by the recipe memory to store each item of
	event entry message	the event entry message base (R)
	base	
9058~9059	Size of event entry	Size used by the recipe memory to store the event entry
	message base	message base, including management message (R)
9060~9075	Numeric input & text	LW9075 includes the recently entered data (Numeric
	input	Value or Text) (R)
9100	Change address:	9100 stores the window number.
9101	Applicable only to the	9101 stores the offset of PLC address.
	external PLC	When LW9100 is set to 11 and LW9101 is set to 20, the
		PLC word addresses of all components in window 11 will
		be added with an offset of 20, that is, D10 changing to
		D30, and all bit addresses will be added with an offset of
		20*16=320, that is, M20 changing to M340.
9150	In the case of Pinyin	The value of LW9150 is the serial number of the Chinese
	input method, used	character displayed in the current Chinese window

	to turn the window
	with Chinese
	characters
9152~9167	In the case of Pinyin
	input method, used to
	displayed the
	currently entered
	Pinyin characters
9170	Used to scroll in The value indicates the starting line of the input area
	notepad component
9130	Contents of online
	switching text base,
	the value indicates
	text base index
9140	Display brightness Used by MT4000 series to display brightness level
	level
9141	Display contrast level Used by MT4000 series to display contrast level

11.3 Nonvolatile Local Word (LW10000~10256)

RTC		
Address	Description	Remark
10000	RTC second	BIN code, value range 0~59 (R/W)
10001	RTC minute	BIN code, value range 0~59 (R/W)
10002	RTC hour	BIN code, value range 0~23 (R/W)
10003	RTC date	BIN code, value range 0~31 (R/W)
10004	RTC month	BIN code, value range 0~12 (R/W)
10005	RTC year	BIN code, value range 0~9999 (R/W)
10006	RTC day	BIN code, value range 0~6 (R/W)
Note on R	TC:	
	n disnlav system tir	me with corresponding component with its value writable

A user can display system time with corresponding component, with its value writable. However, the user has to make sure its value must be within the value range.

For example, the second cannot be written as 78 (BIN). If it is written as 78, RTC will continue the sequence as 78 79 80..., which may result in unpredictable errors.

٦

Mapping of other system parameters (Note: changes on these registers will take effect after restarting the panel)

System pa	irameter settings:	
Address	Description	Remark
10010	Startup window number	0~65535
10011	Screen saver time	Set to 0 will disable the screen saver, Value larger
	setting(backlight and energy	than 0 will enable the screen saver, The valid
	saving)	range is 1-600 (minute). If the value is 10, the
		panel will enter screen saver after 10 minites with
		no touch operations.
10012	Buzzer	0: Disable 1: Enable
10013	Common window/pop-up	0: Normal 1: shown above other windows
	window	
10014	Common window/properties	0: Below base window
		1: Above base window
10015	Number of stored events	0~65535
10016	RTC source	0:PLC (Local Word) 1: Internal RTC
10017	Default language	0~3

System parameter settings:

	device)	
10063~64	PLCCommunication Time out	
10065~66	Protocol Time out 1	
10067~68	Protocol Time out 2	

#1: If LB9044 is set to ON, communication settings will be written back to the system E²PROM, including IP address and port number.

If LB9050 is set to ON, some system parameters will be restored to factory default settings.

Note:

- When the local addresses exceed 10000, the system does not support dynamic modification function in simulation mode; however, the addresses can be read.
 (For example, the address is LW10005 and the offline simulation displays as 2006. However, the value cannot be modified in the offline simulation mode, and it can be modified when run on the actual panel.)
- 2. The offline simulation mode does not support backlight control function.
- 3. The offline simulation mode does not support the use of video components.
- 4. The offline simulation mode does not support print function.

Chapter 12 Security Level

Security level is used to set different access rights for different users, and only the user with high-level password can access windows with high security levels, which greatly enhances the security of application projects.

In the (**Window Properties**) window, there is a (**Security Level**) option. In other words, we can set the security level for any window, as shown below:

Window Attribution		×
Window		
Na Frame7	No. 7 Safe Level Lowe -	
Special Attribute	Print page - Di Normal Keyboard	
Position Init.Pos.:X 0	Y 0 Width 320 Height 240	
Bottom Window-	Use Background Color	
1 None - 2	None Some Filled Color Background	-
Frame Width 0	Frame Color Pop Window Type Image: Tracking Image: Monopoly Image: Clipping Image: Coherence	
	ОК	

Please not the security level setting is valid only for base windows and not available for other windows. A project has three security levels, namely, high (2), medium (1), and low (0). When creating a new window, the default security level is low. In the (**HMI Properties**) window, the user can set the password for each security level. When a user is in a high security level, he can access windows with lower security levels; however, if the user is in a low security level, he cannot access windows with higher security levels. It helps to enhance security. For example, important keys can be configured in a window with high security level; therefore, a user cannot access such keys in general and can only access such contents after entering the password of high security level.

The following is an example on the use of security level. Firstly, select (File) \rightarrow (New Project) to create a new project. Then, double click [HMI] in the (Project Structure Window). In the (HMI Properties) window, click the (Touch Screen Extended Properties) tab and then set password for three security levels. Here, we set the password for level 1 security to 1111, as shown below.

Chapter 13 Serial Communication

13.1 Serial Communication

Serial communication means the bit-by-bit transfer between different equipment through two data signal cables (sometimes, a control line is required). Each data bit occupies a fixed time length. This communication mode uses less data cables and features low cost.

The following is the data frame of a byte in asynchronous communications mode, consisting of start bit, data, parity bit, and stop bit.

In general, logic 1 (MARK) = $-3V \sim -15V$, logic 0 (SPACE) = $+3 \sim +15V$, and each data frame (7 or 8 bits) consists of a high-voltage start bit, a low-voltage stop bit, and a parity bit. The **Bits Per Second** of data usually consists of 9600 Bit/S, 19200 Bit/S, 38400 Bit/S or 115200Bit/S.

During transmission of serial data, an error may occur due to interference. For example, the bits for the character "E" during transmission are: 0100, 0101=45H. However, due to interference, the bit may change to 1. In this case, we call it a "bit error". The method used to check errors occurred during transmission is "error detection"; the methods used to correct an error after detecting it is called "error correction". The simplest error detection method is "parity check", that is, an additional odd/even parity bit is transferred along with the bits of characters to be transferred. Either odd parity or even parity may apply.

• Odd parity: Among all bits to be transferred (including bits of characters and the parity bit), the number of all "1" is an odd number, for example:

In the 8-bit data 01100101, the number of "1" is an even number; we append a 1 to change it to an odd number, so the parity bit is 1.

In the 8-bit data 01100001, the number of "1" is an odd number; we append a 0 and it remains to be an odd number, so the parity bit is 0.

• Even parity: Among all bits to be transferred (including bits of characters and the parity bit), the number of all "1" is an even number, for example:

In the 8-bit data 01100101, the number of "1" is an even number; we append a 0 and it remains to be an even number, so the parity bit is 0.

In the 8-bit data 01100001, the number of "1" is an odd number; we append a 1 to change it to an even number, so the parity bit is 1.

When the parity check is adopted, 1-bit error can be detected, but 2-bit or high errors cannot be detected. Furthermore, detected errors cannot be corrected. Upon detection of an error, it will request for retransmission. However, since it is easy to implement, it is widely applied.

To implement communication between two parties, the settings of data bit, start bit, stop bit, bits per second and parity check for serial ports of both parties must be set to be the same.

The eView MT5000/4000 and most PLCs support only asynchronous transfer mode. Our description is also based on asynchronous transfer mode. (If you are interested in synchronous transfer mode, please refer to related documents). Certainly, entity interfaces are required as transmission media to send or receive data in asynchronous transfer mode. This is the difference between RS-232, RS-422 and RS-485, as detailed respectively below.

13.2 RS-232

Presently, RS-232 is the most widely applied serial interface in PC and communication industry. RS-232 is defined as a single-ended standard to extend communication distance in low-rate serial communication. RS-232 adopts an Unbalanced Data Transmission (UDT) interface, under which the voltage of a single cable relative to a grounding signal cable is used to indicate the logic status Mark or Space. A typical connection method is shown as follows:

Pinout of a typical RS-232 interface (PC Compatible) is shown as follows:

Pin No.	Pin Name	Description
1	Carrier Detect (CD)	
2	Received Data (RD)	Data receiving signal cable
3	Transmitted Data (TD)	Data transmission signal cable
4	Data Terminal Ready (DTR)	
5	Signal Ground	Grounding signal cable
6	Data Set Ready (DSR)	
7	Request To Send (RTS)	
8	Clear To Send (CTS)	
9	Ring Indicator (RI)	

Pinout of the eView MT5000/4000 RS232 is shown as follows:

Pin No.	Pin Name	Description
2	Received Data (RXD)	Data receiving signal cable
3	Transmitted Data (TXD)	Data transmission signal cable
5	Signal Ground	Grounding signal cable
7	Clear To Send (CTS)	CTS and RTS work only on
8	Request To Send (RTS)	some PLCs
		(Only COM1 supports CTS
		and RTS)

If without CTS or RTS, the typical connection between the eView 5000/4000/PLC [RS-232] and PLC is shown as follows:

Since RS-232 adopts the full-duplex transmission mode, it has independent transmission (TD) and receiving (RD) signal cables and a grounding signal cable. The purpose of CTS and RTS is intended for handshaking control between the eView MT5000/4000 and the PLC. The CTS or RTS of only a few PLCs must be controlled by the eView MT5000/4000.

The length of RS-232 connection cable is often a question. The standard length shall not exceed 50 feet (1 foot = 30 cm), or the capacitance shall not exceed 2500 pF. Based on capacitance standard, the typical capacitance of a UTP CAT-5 connection cable is 17 pf/feet, and the maximum

length of a connection cable is 147 feet (that is, about 44 m). The value may be larger in the case of a shielded cable, and the value may be smaller when the cable is used in an environment with considerable interference.

Since RS-232-C interface standard was developed in an earlier time, it has the following defects:

- (1). The signal level value of the interface is high, which may easily cause damage to chips of the interface circuitry.
- (2). The transmission rate is low, with a baud rate of 20 Kbps in asynchronous transmission mode.
- (3). The interface uses a signal cable and a signal return cable to form a common ground transmission mode. This common ground transmission may easily lead to common-mode interference. Therefore, the noise suppression and anti-interference capability is low. The higher the baud rate is, the lower the anti-interference capability will be.
- (4). The transmission distance is rather limited.

13.3 RS-422

RS-422 and RS-485 are different from RS-232. For RS-422 and RS-485, data signals are transferred in differential transmission mode, that is, balanced transmission mode. It uses a pair of twisted pair cables, with one cable defined as A and the other defined as B. In general, the positive level between the transmission drivers A and B is at $+2 \sim +6V$, which indicates a logic state, while the negative level is at $-2 \sim 6V$, which indicates another logic state. In addition, there is a signal ground C and an "Enable" end in the RS-485, while they are optional in the RS-422. The "Enable" end is used to control the connection/disconnection between the transmission driver and the transmission line. When the "Enable" end is active, the transmission driver is in a high-impedance state, that is, "the third state", a state different from the logic "1" and logic "0", as shown in the figure below:

Corresponding specifications are made for the receivers. AA and BB are connected with balanced twisted pairs between the transmission end and the receiving end. When the level between AB at

the receiving end is greater than +200 mV, it outputs positive logic level; when the value is less than -200 mV, it outputs positive logic level. The level range received by the receiver on the balanced cable is from 200 mV to 6V, as shown in the figure below:

RS-422 standard stands for Electrical Characteristics of Balanced Voltage Digital Interface Circuits, which defines the characteristics of the interface circuits. The following figure shows a typical 4-wire RS-422 interface. In fact, it has another signal ground cable and totally 5 cables. Since the receiver adopts high input impedance and the transmission driver has high driving capability than RS-232 interface, a maximum of 10 receiving nodes can be configured in the same transmission cable. Among all these nodes, one is the master node and the others are slave nodes. Slave nodes cannot communicate with each other. Therefore, RS-422 interface supports point-to-multipoint bidirectional communication. Since the 4-wire RS-422 interface adopts independent transmission and receiving channels, it is unnecessary to control data direction. Any necessary handshaking between different devices can be implemented either in software mode (XON/XOFF handshaking) or in hardware mode (a pair of independent twisted pairs).

RS-422 interfaces support a maximum transmission distance of 4000 feet (about 1219 meters) and a maximum transmission rate of 10 Mb/s. Where, the length of the balanced twisted pair is in inverse proportion to the transmission rate, and the maximum transmission distance can be achieved only at the rate of 100 Kb/s. The maximum transmission rate can be achieved only within a very short distance. In general, a twisted pair as long as 100 meters can have a maximum transmission rate of 1 Mb/s. RS-422 needs a terminating resistor, while its resistance is equal to the characteristic impedance of the transmission cable. The terminating resistor is not required for short-distance transmission within 300 meters. The terminating resistor is connected to the farthest end of the transmission cable.

The pinout of the eView MT5000/4000 RS-485 (4-wire) is shown as follows:

Pin No.	Pin Name	Description
1	RX-	Data receiving signal cable A
6	RX+	Data receiving signal cable B
4	TX-	Data transmission signal cable A
9	TX-	Data transmission signal cable B
5	GND	Grounding signal cable

13.4 RS-485

Since RS-485 is developed on the basis of RS-422, many electrical specifications of the RS-485 are similar to those of the Rs-422. Both of them adopt balanced transmission mode and the transmission cables have to be configured with terminating resistors. RS-485 supports 2-wire and 4-wire modes. The 2-wire mode supports real multipoint bidirectional communication, where the "Enable" signal controls the transmission and receiving of data, as shown in the figure below:

Electrical characteristics of the RS-485 are as follows: Logic "1" is indicated by the voltage difference of + (2~6)V between two cables; logic "0" is indicated by the voltage difference of - (2~6)V between two cables. RS-485 supports a maximum transmission rate of 10 Mbps. RS-485 interface adopts a combination of balanced drivers and differential receivers to enhance its capability of preventing common-mode interference, featuring better noise suppression and anti-interference performance. The standard maximum transmission distance is 4000 feet, but it can achieve an actual distance of 3000 meters. In addition, the bus of the RS-232 interface can be connected with only one receiver, that is, the single station capability. However, the bus of the RS-485 can be connected with a maximum of 128 receivers, that is, the multi-station capability. Therefore, the user can set up an equipment network with a single RS-485 interface. Since the RS-485 interface has excellent noise suppression and anti-interference performance, long transmission distance, and multi-station capability, it is widely applied. Because the half-duplex network established through the RS-485 interface needs two connection cables, the RS-485 interface adopt shielded twisted pairs for transmission cables.

Pinout of the eView MT5000/4000 RS-485 (2-wire) is shown as follows:

Pin No.	Pin Name	Description
1	RX-	Data receiving/transmission signal cable A
6	RX+	Data receiving/transmission signal cable B
5	GND	Grounding signal cable

Chapter 14 Connection of eView MT5000/4000 with Common PLCs

14.1 OMRON PLC

Connection of OMRON C Series PLC with MT5000/4000 Touch Screen

• EV5000 software setting:

ltem	Recommended Setting	Optional Setting	Precaution
PLC Type	OMRON CPM2AH	OMRON	
COM	COM0/COM1	RS232/RS485	
Data Bits	7	7 or 8	Must be the same as the COM port settings of the PLC
Stop Bits	2	1 or 2	Must be the same as the COM port settings of the PLC
Bits per	9600	9600/19200/38400/	Must be the same as the COM
Second	3000	57600/115200	port settings of the PLC
Parity	Even parity	Even parity/odd parity/none	Must be the same as the COM port settings of the PLC
PLC Station	0	0-255	Must be the same as the COM
No.	5	0 200	port settings of the PLC

◆ PLC software setting:

Set the communication protocol of the COM port to Hostlink.

Please refer to related PLC programming software user manual of OMRON

Reference website: <u>HTTP://oeiweb.omron.com/oei/TechManuals-PLC.htm</u>

• Operable address range:

PLC Address Type	Operable Range	Format	Description
IR	0-65535	DDD(BB)	I/O and internal relay
HR	0-65535	DDD(BB)	Holding relay
AR	0-65535	DDD(BB)	Auxiliary relay
LR	0-65535	DDD(BB)	Link relay
TC	0-255	DDD	Timer/counter register
DM	0-9999	DDD	Data register

Note: D indicates decimal notation, B indicates bit code, and the value range is 0 ~15. The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: The CPU of CPM1/CPM1A series does not provide standard serial ports and has to be configured with OMRON CPM1-CIF01 (RS232) communication adapters or OMRON CPM1-CIF11 (RS422) communication adapters to establish the link with the touch screen through the Host-Link. The CPU of CPM2A PLC provides RS-232 interface and it can be connected with the touch screen directly; it can also be configured with CPM1-CIF01 (RS232) communication adapters or OMRON CPM1-CIF01 (RS232) communication adapters or OMRON CPM1-CIF01 (RS232) communication adapters or OMRON CPM1-CIF11 (RS422) communication adapters to establish a link. For hardware descriptions, refer to manuals provided by OMRON.

Note: D indicates decimal notation, B indicates bit code, and the value range is 0 ~15. The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: OMRON CQM series of PLCs covers CQM1 and CPM1H series. Where, CQM1-CPU11 and CQM1H-CPU11 do not provide standard serial ports and have to be configured with OMRON CPM1-CIF01 (RS232) communication adapters or OMRON CPM1-CIF11 (RS422) communication adapters to establish the link with the touch screen through the Host-Link. Other CPUs of CQM series provide RS-232 interface and it can be connected with the touch screen directly; they can also be configured with CPM1-CIF01 (RS232) communication adapters or OMRON CPM1-CIF11 (RS422) communication adapters to establish a link. Where, CPU51/61 of the CQM1H series support serial communication module CQM1H-SCB41. For hardware descriptions, refer to manuals provided by OMRON.

DM	0-9999	DDD	Data register

Note: D indicates decimal notation, B indicates bit code, and the value range is 0 ~15. The operable range in the above table indicates the operable range of the MT5000/4000 touch

OMRON PLC

screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: OMRON C200H series PLCs include C200H, C200HS and ALPHA series. Where, ALPHA series consist of such models as C200HX/HG/HE. C200H series PLCs can be connected with the touch screen through the HOSTLink protocol with the RS-232 interface on the CPU. They can also be configured with various compatible HOSTLink communication modules provided by OMRON to connect with the touch screen. Please pay attention to software and hardware settings. For hardware description, refer to manuals provided by OMRON.

1. CPU (C200H/HS/ALPHA series PLC)

eView MT5000/4000 touch	C200H CPU RS-232

• Operable address range:

Note: D indicates decimal notation, O indicates octal notation, and the value range is 0 ~7. The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: MITSUBISHI FX series PLCs include such models as

FX0/FX0s/FX0n/FX1s/FX1n/FX2nc/FX2n. All of them can be connected with the eView touch screen either through the programming COM port in the CPU or through the communication interface board 232BD or 485BD. When BD module is used, select such PLC types as MITSUBISHI FX0n/FX2/FX2n COM and pay attention to the settings of the communication format register D8120. Set the b9 and b8 of BFM#0 to 0. For detailed hardware description, refer to the technical manuals provided by MITSUBISHI.

14.3 KOYO PLC

Koyo Electronics

Connection of KOYO Direct Logic Series PLC with eView MT5000/4000 Touch Screen

• EV5000 software setting:

ltem	Recommended	Optional Setting	Precaution
nem	Setting	Optional Setting	Frecaution
	KOYO		
PLC Type	DIRECT		
СОМ	COM0/COM1	RS232/RS485	Set it according to the type of
COM	COMO/COMT	10202/10400	COM port actually in use
Data Bits	8	7 or 8	* Data bits for this protocol are
Data Dits	0	7 01 0	set to 8 in a fixed manner
Stop Bits	1	1 or 2	Must be the same as the COM
	I	1012	port settings of the PLC
Bits per Second	9600	9600/19200/38400/	Must be the same as the COM
Bits per Second	9000	57600/115200	port settings of the PLC
Darity	Odd parity	Even parity/odd	Must be the same as the COM
Parity	Out parity	parity/none	port settings of the PLC
PLC Station	1	1-90 *	Set this parameter according to
No.	1	1-90	the recommended settings

- PLC software setting:
 - 1. The security password function must be disabled.
 - 2. The COM port must adopt K sequence protocol.
 - 3. Set the switch of the CPU with working mode setting switch to the TERM state.

For other settings, refer to related PLC programming software user manual provided by Koyo Electronics.

Reference website: <u>Http://www.automationdirect.com</u>

• Operable address range:

PLC Address Type	Operable Range	Format	Description
х	0-32767	000	External input node
Y	0-32767	000	External output node
С	0-32767	000	Internal auxiliary node
Т	0-32767	000	Timer node
СТ	0-32767	000	Counter node
V	0-32767	0000	Data register

Note: "O" indicates octal notation.

Presently, EV5000 does not support some PLC address types. They can be translated into the addresses actually supported.

The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: KOYO Direct Logic series PLCs cover DL05, DL105, DL205, DL305 and DL405 series. The CPUs of all these series can be connected with the eView MT5000/4000 touch screen through the K sequence serial communication protocol and by the RS-232/RS-422 interface on the CPUs. Where, DL240/DL250 and DL405 series of PLCs can be connected with the touch screen through data communication modules. For related software and hardware settings, refer to the technical manuals provided by Koyo Electronics.

1. CPU (DL05/DL105/DL230/DL240/DL250/DL350/DL450 RS232 Port)

Please refer to related PLC programming software user manual of SIEMENS.

Reference website: <u>Http://www.siemens.com/s7-200</u>

• Operable address range:

PLC Address Type	Operable Range	Format	Description
I	0-4095.7	DDDO	External input node
Q	0-4095.7	DDDO	External output node
М	0-4095.7	DDDO	Internal auxiliary node
VW	0-5120	DDDD	Data register

Note: D indicates decimal notation, O indicates octal notation, and the value range is 0 ~7. Note that the start bit of the VW address must be an even number.

If it is necessary to operate the double word variable, select 2 in the corresponding component address properties dialog box.

The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: SIEMENS S7-200 series PLCs cover such models as CPU212, CPU214, CPU215, CPU216,

CPU221, CPU222, CPU224 and CPU226. All of them can be connected with the eView touch screen through the programming communication port (PPI port) on the CPUs. Where, CPU226 has two communication ports: either one can be used to connect the touch screen, but the communication parameters for them have to be set separately. While connecting PLC directly with the touch screen through the CPU, pay attention to the setting of communication parameters in the software. For detailed settings, refer to the technical manuals provided by SIEMENS.

Data Bits	8	7 or 8	Data bits for this protocol are set to 8 in a fixed manner
Stop Bits	1	1 or 2	Must be the same as the COM port settings of the PLC
Bits per Second	9600/19200	9600/19200/38400/ 57600/115200	Must be the same as the COM port settings of the PLC

Parity	Odd parity	Even parity/odd parity/none	Must be the same as the COM port settings of the PLC
Human-machine station No.	0	0-255	It is not required to set this protocol
PLC Station No.	2	0-255	Must adopt recommended settings
Multiple human-machine interconnection	Disabled	Disabled/Master/Slave	Applicable only to multiple human-machine interconnection
Human-machine interconnection rate	38400	38400/115200	Applicable only to multiple human-machine interconnection
PLC timeout constant	3.0	1.5-5.0	Adopt default settings
PLC packet	0	0-10	Recommended value range: 0-10

Note: The part number of SIEMENS S7/300 HMI adapter is 6ES7972-0CA10-0XA0, and that of SIEMENS S7/300 PC adapter is 6ES7972-0CA23-0XA0. When a PC adapter is used, the baud rate (bits per second) can be set to 19200 or 38400 only, depending on the setting of the DIP switch on the adapter. For details, refer to the product catalogue of SIEMENS.

• PLC software setting:

It is required to create data block DB10.

For creation procedures, please refer to related PLC programming software user manual of SIEMENS.

Reference website: <u>Http://www.aut.sea.siemens.com/s7-300</u>

• Operable address range:

PLC类型选择为: PC adapter

PLC类型选择为: HMI adapter

PLC 地址类型	可操作范围	格式	说明

PLC 地址类型	可操作范围	格式	说明
Ι	0-4095.7	DDDO	外部输入节点
Q	0-4095.7	DDDO	外部输出节点
м	0-4095.7	DDDO	内部辅助节点
DB10	0-8192	DDDD	数据寄存器

Note:

- 1) D indicates decimal notation, O indicates octal notation, and the value range is 0 ~7. Please note that VB10 is DB10, and the start bit of the VB10 address must be an even number.
- 2) If it is necessary to operate the double word variable, select 2 in the corresponding component address properties dialog box.
- 3) The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.
- Detailed wiring diagram:

Note: SIEMENS S7-300 series PLCs cover such models as CPU312, CPU313, CPU314, CPU315, CPU316, and CPU318. All of them can be connected with the eView touch screen through the HMI adapter or PC adapter provided by SIEMENS. Presently, MT5000 series of touch screens do not support CP340 and CP341 communication modules of SIEMENS. When the PLC communicates with S7-300, it is necessary to create the data block DB10. MT5000 series exchange data with the S7-300 through the DB10. When using an adapter, pay attention to the setting of the DIP switch, and it is necessary to define the data format as byte when creating the DB10. For detailed settings, refer to the technical manuals of SIEMENS.

F	0-255F	DDD(H)	Special relay node
T/C	0-255	DDD	Timer/counter node
D	0-9999	DDD	Data register

• Operable address range:

Note: D indicates decimal notation, H indicates hexadecimal notation, and the value range is 0 ~ F. It supports T and C nodes only when LG K10S1 is adopted.

The operable range in the above table indicates the operable range of the MT5000/4000 touch screen. The actual range of the PLC may be broader or narrower than this range.

• Detailed wiring diagram:

Note: LG Master K series PLCs cover independent type and substrate type. Where, the independent type covers LG Master K 10S1/10S/30S/60S/80S series of CPUs, and the substrate type covers LG Master K200S/300S/1000S series of CPUs. They all can be connected with the eView touch screen through the communication port on their respective CPUs. In addition, Master K80S/200S/300S/1000S series of CPUs can be connected through the extended Cnet module. Please note that different PLC types must be set in the touch screen software when different PLC CPUs are adopted. When Cnet protocol is used, pay attention to the setting of communication protocols. For setting methods, refer to operating instructions provided by LG Industrial Systems.

1. CPU (K10S1/K10S/K30S/K60S/K80S/K200S/K300S/K1000S RS232)

eView MT5000/4000 touch	LG Master K PLC

Chapter 15 Operation Instructions for EVManager

The EVManager management and configuration tool is shown in the following figure. This chapter introduces the usage of this tool.

🖮 stepservo	• 🛅 eV5000	EV5000.exe
		🚯 EVManager.exe
		🍿 Uninstall

15.1 Introduction to EVManager

EVManager is the management and configuration tool for the EV5000 software. The EVManager tool consists of three operation processing modules: download, upload, and system operate. The structural diagram is shown as follows:

Select [**Start**]→[**Programs**]→[**stepservo**]→[**ev5000**]→[**EVManager**], the EVManager dialog box appears, as shown below:

🔁 EVManager		
Download Operate	Communication Set Communication Type: NetWork	
Upload Operate	IP: 255.255.255.255	PORT: 21845
System Operate	Serial NO: NULL	Set

	< <bac1< th=""><th>K NEXT>> Exit</th></bac1<>	K NEXT>> Exit

The section below will give a detailed description of different modules of the EVManager.

15.2 Download Operate

Download processing is mainly used for downloading files from a PC to the HMI panel. Communication parameters must be properly set before downloading..

- Communication parameter setting: Select communication mode, the same as the Tools->Setting option in the configuration window. Please refer to Chapter 3 of this manual for downloading description.
- Selecting communication mode:

Click Set, the Communication Parameter Setting dialog box appears.

a. Download via Ethernet (Valid for MT5000 and MT4000E only)

In the setting dialogbox, select the Ethernet option, change the IP address to the IP address of the touch screen, do not modify the port number, and click [**OK**].

Download Operate	Communication Communicatior	. Set n Type: USB port			
Upload Operate	IP: M	ULL.		PORT: NULL	
	- · · · · · · · · · · · · · · · · · · ·	IT T		_

Click [BACK] and [NEXT] to switch between Download Operate, Upload Operate and System Operate.

15.3 Upload Operate

Upload processing is used to transfer data files from the touch screen to a PC.

Communication parameters must be properly set before uploading.

Communication parameter setting: the same as those described in downloading processing.

Upload section: in this area, the user can select the file type of uploading data

Upload user data: upload the data stored in the panel to the PC, the uploaded file will be saved as *.pkg file, the same as the user data file for downloading. Click "Upload user data" button,

a dialog box appears and prompt the user to enter the HMI description, which can help the user distinguishi different panels.(Figure)

Select **Data File** (must be selected, the user can select logo file and recipe file also), click [**OK**]. Select a file saving path, enter a file name and click **Save**. The user data file is saved as *.pkg file. The **Upload Password** dialog box appears. Enter **the password** (this password can be set in the HMI attribution dialogbox, see chapter 7) and click [**OK**] to begin the uploading process.

Note: The default upload password is 888888 if it has not been set in the HMI attribution dialogbox, as the following figure shows:

To upload the LOGO file or recipe file, select these two options. Logo and recipe file are uploaded and stored into the *.pkg file with the user data in this method.

Click **Upload Recipe**, select a file saving path, enter a file name, and then click **Save**. Recipe file is uploaded and saved as a separated *.rcp file in this method.

Click **Upload LOGO**, select a file saving path, enter a file name, and then click **Save**. Logo file is uploaded and saved as a separated *.logo file in this method.

Note: The file name and file saving path of the uploaded file are determined by the user.

15.4 System Operate

System Operate is mainly used for refreshing the embedded OS files and testing.

- **Communication parameter setting**: the same as those described in download operate.
- **Get IP/PORT Information**: To obtain the IP and port number information of the touch panel (only MT5000 series support this function), click **Get** to display the IP address and port number of the target panel.

🕺 EVII anager	
Download Operate	Communication Set Communication Type: USB port
Upload Operate	IP: NULL PORT: NULL
System Operate	Serial NO: NULL Set
ि Get Version	Get HMI IP/PORT information IP: 192 168 0 254 PORT: Get Refresh IP/PORT IP: . . PORT: Refresh Return Section Return Vser Application Status Return Set Application Status Write Rootfs
	<gack next="">> Exit</gack>

• Update IP/PORT: Modify the IP address and port number of the touch screen (Only MT5000

series support this function).

Enter an IP address, like 192.168.0.255. It is usually not required to modify the port number. Click **Update**, and the **Setting IP/PORT Successful** dialog box appears. Click **OK**, and the IP address of the target panel changes to 192.168.0.255.

	-Communication Set
Download Operate	Communication Type: USB port
Upload Operate	IP: NULL PORT: NULL
System Operate	Serial NO: NULL Set
Get Version	Get HMI IP/PORT information IP: 192 . 168 . 0 . 254 PORT: 2008 Get

ОК	turn Set Application Status Write Rootfs
	<gback next="">> Exit</gback>

Click **Get**, and the IP address of the target screen is displayed as 192.168.0.255. It means the IP address is successfully modified.

🕺 EVI anager	
EVEnage: Image: Imag	Communication Set Communication Type: USB port IF: NULL FORT: NULL Serial NO: NULL Set Get HMI IP/PORT information IP: 192 . 168 . 0 . 254 PORT: 2008 Get Refresh IP/PORT
	IP: 192 . 168 . 0 . 253 PORT: 2008 Refresh Return Section Refresh Section Write Kernel Write Kernel Return Set Application Status Write Rootfs Write Rootfs (CBACK) NEXT>> Exit

Note: To obtain IP/update IP address, the user can only select the communication mode of serial port or USB.

• Jumping Selection Area:

Jump to User Program Status: The target panel jumps to run the configuration program. **Jump to Setup Program Status**: The target panel changes to the SETUP interface.

• Update Operation Area:

To update the kernel or file system of the embedded OS, the user can only select the communication mode of serial port or network port (MT4000 series use serial port, and MT5000 series use serial port or network port). Before updating operation, switch the DIP switch 1 on the back of the target screen to **ON** and DIP switch 2 to **OFF**. After connecting and switching the DIP switch, click "Write Kernel" or "Write Rootfs" to conduct the update. The user can update any one part of the two and doesn't need to update the two parts together all the time.

Note: After the updating OS kernel and root file system operation is conducted, the target screen restores to the factory default settings. Be cautious on such operation. This function is only available for advanced users.

Make sure the power supply of the panel is good during the OS kernel/root file system updating. Unpredictable errors may occur if power goes off during downloading. The updating operation is necessary only when the embedded OS is permanently damaged and it is strongly recommended that the user conduct this operation with the help of our technician.

Chapter 16 Use of Setup

The DIP switches on the back of the panel are shown in the following figure:

Normal working mode

1 ON 2 OFF

Firmware update and basic parameter setting mode

1 OFF 2 ON

Touch screen calibrate mode (available after updating kernel and file systems)

1 ON 2 ON

System setting (Adjusting brightness, contrast, date, and so on)

- System Setting Mode: In this mode, the touch screen will start a built-in system setting interface, where the user can set such parameters as IP address, brightness, contrast, and buzzer.
- **Touch Screen Calibrate Mode**: In this mode when you touch the screen, the screen will display a "+" sign, through which you can calibrate the touch accuracy of the screen.
- Firmware Update and Basic Parameter Setting Mode: In this mode the user can update firmware, set IP address, and perform other lower-level operations. In general, do not use this mode.
- **Application** (**Online Operation**) **Mode**: This is the normal working mode of MT5000 series touch screens. The screen will display the starting picture of the downloaded project.
- 1. Set DIP switches 1 and 2 on the back of the touch screen to "ON" and press the [Reset] key.

The Setup interface for the eView MT4000 and MT5000 series appears.

Startup Window No.: Startup window, 0 by default. Modify the parameter only when necessary. After modification, re-download or reset the touch screen, and the modified window will appear.

Backlight Saver Time: Screen saver time, in the unit of minute. The default value is 10. No screen saver will be available when the value is set to 0. The time can be modified.

The **Setup** interface may not be able to display in full size in a single screen. In this case, click [**Next**] to enter the next page and click [**Back**] to return to the previous page.

Calibrate Time: Check whether the year, month, day, hour, minute, and second is the current time. If the time is not consistent with the current time, calibrate the time manually.

IP Address Setup: Modify the IP address and port number (PORT) of a target screen. It is necessary to reset the screen after modification.

Buzzer Disabled: Enable/disable the buzzer. After setting the option, it is necessary to reset the screen.

Adjust contrast (Contrast Up/Down) and brightness (Brightness Up/Down) to achieve the best visual effect.

Adjust contrast and brightness according to different models of HMIs:

5300L/5500L/4500L/4300L/4300S: Adjust contrast

5300S/5400S: Adjust contrast and brightness

5300T/5400T/5500T/5600T/5700T/4300T/4400T/4500T: Adjust brightness

4300C: No contrast or brightness adjustment function

Calibrate touch screen: Set DIP switch 1 to "OFF" and DIP switch 2 to "ON". Follow the "+" sign until you hear a click sound and the "+" sign disappears. Then, set DIP switch 1 and 2 to "OFF" and press [Reset].

Chapter 17 Networking of MT5000 Series Touch Screens

17.1 Networking

17.1.1 Networking of One Touch Screen with Two PLCs of Any Brands

Communication mode of these two PLCs can be 232, 485 or 422.

It is shown in the figure below:

One MT5300T touch screen, with COM1 connected with a Siemens S7 200 PLC and COM0 connected with an OMRON PLC.

Caution:

- Since COM1 is connected with a Siemens S7 200 PLC, COM1 must be set with the communication parameters of the Siemens S7 200 PLC. Since COM0 is connected with an OMRON PLC, COM0 must be set with the communication parameters of the OMRON PLC. Parameters on the right are default parameters and they will be created after the touch screen is connected with the PLC. Only an advanced user can modify these parameters; otherwise, it may cause communication errors.
- 2. The settings of these communication parameters depend on the internal communication parameters of the PLC, so they may vary in different situations.

Set the communication parameters of the Siemens S7 200 PLC as follows: Communication mode: RS485-2; "Bits per second": 9600; data bits: 8; parity check: even parity; stop bits: 1, as shown below:

HMI Attrib	ute			×
HMI	Task		HMI Extend Attribute	Print Setting
Seri	ial Port O	Setting	Serial Po	rt 1 Setting
Туре	RS485-2	-	PLC Communication Time Out	1
Baud Rate	9600	•	Protocol Time Out 1	0
Data Bit	8	•	Protocol Time Out 2	1
Parity	even	•	Max interval of block pack(WOF	RDS) 4
Stop Bit	1	•	Max interval of block pack(BITS	;) 8
Slave No.	0		Max block package size(WORE)S) 16
			Max block package size(BITS)	64
				确定 取消

Double click the Siemens S7 200 PLC and set the PLC station No. to 2, as shown below:

PLC At	tribute		
PLC]		
No.			
IP	192 . 168 . 0 . 128	Port 2007	
			 取消

Set the communication parameters of the OMRON PLC (settings of COM0) as follows: Communication mode: RS232; "Bits per second": 9600; data bits: 7; parity check: even parity; stop bits: 2, as shown below:

HMI	Tasl	k Bar	HMI Extend Attribute		t Setting
Ser	ial Port () Setting	Serial Port	t 1 Set	ting
Туре	RS232	-	PLC Communication Time Out		3
Baud Rate	9600	•	Protocol Time Out 1		50
Data Bit	7	-	Protocol Time Out 2		3
Parity	even	•	Maxinterval of block pack(WORD)S)	16
Stop Bit	2	•	Maxinterval of block pack(BITS)		64
Slave No.	0		Max block package size(WORDS)	32
			Max block package size(BITS)		128

Double click the OMRON PLC and set the PLC station No. to the default value 0, as shown below:

PLC At	rtribute 🛛 🗙
PLC	
No.	2
IP	192 . 168 . 0 . 128 Port 2007
	确定 取消

Right click on HMI0 and select the (**Edit Configuration**) menu to enter configuration window 0, as shown below:

To set other components, select corresponding PLC numbers.

17.1.2 Networking of One Touch Screen with Multiple PLCs

Caution:

- 1. When a touch screen is connected with multiple PLCs, the communication mode can only be RS-485 instead of RS-232.
- 2. The same COM port must be connected with same PLCs or the PLCs supporting the same protocol.

As shown in the figure below, COM1 is connected with 2 Siemens S7 200 PLCs, and COM0 is connected with 3 MODBUS RTU PLCs, or 3 PLCs supporting the MODBUS RTU protocol (for example: LG MODBUS RTU, EMERSON MODBUS RTU, Schneider MODBUS RTU). However, during configuration, these three PLCs must select MODBUS RTU. In actual connection, the user can use PLCs supporting the MODBUS RTU protocol.

- Setting of communication parameters: The same COM port shall have same settings no matter how many PLCs it is connected to.
 Double click each PLC and modify it to be the corresponding PLC station No. As shown in the figure below: station numbers of the Siemens S7 200 PLCs are respectively 0 and 2, while the station numbers of the MODBUS RTU PLCs are respectively 1, 2 and 3.
- 4. Setting of PLC components: Select corresponding PLC number.

HM	IU		· · · ·	· · · ·	Modbus RTU

17.1.3 Networking of Multiple Touch Screens with One PLC

Caution:

- 1. Different types of touch screens can be connected with each other.
- 2. Different touch screens are connected with each other through the Ethernet.

As shown in the figure below, lead an Ethernet cable from **Communication Connection**.

Connect the Ethernet cable to the **Net** interface of the touch screen and connect two touch screens together in this way.

Lead another Ethernet cable from **Communication Connection** and connect it to the Net interface of a touch screen. In this way, three touch screens are connected, as shown in the figure below:

Connect the PLC with the corresponding touch screen, as shown in the figure below:

Caution: Edit configuration only on the touch screen connected with the PLC. When editing PLC components, do not select the touch screen number and the PLC number, as shown in the figure below:

	•	•	•	•	•		•				
				SB0							
				•		•

17.2 Mutual Download Between Different Touch Screens

Downloading between different touch screens must be conducted via a PC. Firstly, upload from a touch screen to the PC and then download from the PC to another touch screen. For upload methods, refer to related descriptions in Chapter 15.

Caution: Only MT5000 series support networking function.

Appendix I System Messages

MT5000/4000 System Messages Table

Messages	Description
PLC no response: cc-pp-d	PLC no response: Meaning of the three groups of
	digits followed the message:
	HMI No. $-PLC$ station No. $-$ Serial port No.
PLC response error	PLC response error: PLC responds an unexpected
	message, which may be caused by read or write
	command. Check whether the PLC is correctly
	configured.
Socket Connect Error	Network connection error: Check whether the IP
	address, port number, and PLC communication
	parameters are correctly configured.
Socket Comm Error	Network communication error: Please contact us.
Macro Code Error: xxxx (macro No.)	Programming error with macros, so it encounters
	infinite loop or execution timeout. Please check the
	programming code of the macro. The number
	followed is the macro number.
System error	System error, an internal error with the touch screen
Print error	Print error, not connected with the printer or print error
Server Error	Server error

Appendix II Troubleshooting

The following is the method for removing the "PLC no response" and "PLC response error" fault. The flow chart is shown below:

Fault with compilation information:

The user can view the number of errors as well as causes in the compilation information window.

1. Address error or threshold crossing of PLC component, as shown in the following figure:

	HMI

~	macro_O. c	: In fund	ction 'macro_main'	:					

For programs used to modify macro instructions, refer to Chapter 9.

Appendix III Hardware Overview

Installation of MT5000 Series Touch Screens

1. Installation Overview

1.1 Installation Environment

Application
environmentMT5000 series touch screens are industrial products designed for factory
applications. They are designed to work stably in most industrial
environments at the temperature of 32 ~ 113°F (0~45°C). They may not be
applied to some specific outdoor environments. For specific outdoor
applications, do consult your vendor!

NEMA rating (NEMA stands for National Electrical Manufacturers Association)

The front panel of MT5000 series touch screens conforms to the specifications of NEMA 4. When the product is correctly installed in a panel in compliance with the NEMA 4 specifications, the panel still meets the protection requirements of NEMA 4, that is, no liquid will seep through the panel when the panel surface is sprayed with liquid.

Electrical environment

It is proved by test that MT5000 series touch screens meet CE standard. In other words, the circuit design of the product is able to withstand the interference of electrical noise, but it cannot eliminate electrical noise under all circumstances. Correct cabling and correct grounding ensure normal operation of the product.

To ensure normal operation of the product, do not install MT5000 series touch screens in the environment where severe mechanical vibration or shocks are present.

2. Installation Instructions

- 2.1 Installation Instructions
- 2.1.1 Location Considerations

Care should be taken when locating any equipment behind the MT5000 series of products to ensure AC power wiring, PLC output modules, contactors, starters and relays, and any other source of electrical interface are kept away from the back of these products.

Particular care should be taken to the position of variable frequency drivers and switching power supplies. Their input and output cables should be screened to a star earth point.

2.1.2 Making a NEMA-4 Mounting

Panel
DetailsThe MT5000 series of products can be mounted into panels with a depth of
over 105 mm. It is recommended that the product be installed on the front
panel of a steel enclosure. To enable the user to open the front panel of the
panel smoothly, allow a clearance of at lease 25 mm around the sides of the
installed product. To ensure smooth and easy connection of power supply and
cables, it is recommended that a panel with a depth of at least 105 mm should
be adopted.

NEMA-4 Installation Put the unit through the panel holes. Slide the clamps into the 4 holes provided around the case. Tighten the clamping screws in an even pattern until the unit is secured in the panel.

Caution! Do not over-tighten mounting clamps!

Specifications Note:

- **Note:** To seal to NEMA-4 specifications, all supplied mounting clamps must be used and panel cannot flex more than 0.010".
- 2.1.3 Environmental Considerations

- The MT5000 series are to be used indoors as built-in LCD displays. Make sure that the displays are installed correctly and that operating limits are followed (See Hardware Specifications).
- Do not operate the unit in areas subject to explosion hazards due to flammable gases, vapors or dusts.
- The unit should not be installed where fast temperature variations and/or high humidity are present. This will cause condensation of water in the device and cause damage to the unit.

2.2 Power Connections

Make sure all local and national electrical standards are met when installing the unit. For details, refer to a local dealer.

2.2.1 Power Requirements

Fusing

Requirement

Working

Current: **Starting current:** 5300L<1A, 5400T<1.2A, **Power Supply** 5500T<1.2A

current:

5300L<500mA,

5400T<600mA, 5500T<600mA If the display does not come on within 2 seconds of power-up, turn off the power immediately. An internal fuse will prevent damage if the polarity of the DC power is incorrect. Check wiring to ensure proper connections and

try to power up again.

	Caution!	An Internal fuse will prevent damage for over voltage condition, however it isn't guaranteed.
	High Voltage	DC voltage sources should provide proper isolation from main AC power.
	Caution!	A hard-wired Emergency Stop should be fitted in any
(<u>•</u>)	Emergency Stop	system using the MT5000 touch screens to comply with the ICS Safety Recommendations.
		Do not power the MT5000 touch screens and inductive
	Caution!	loads, or input circuitry to the controller, with the same
	Supply Voltage	e power supply.
	Condition	Note: The 24 VDC output from some controllers may not have enough current to power the MT5000.
\frown		Wire lengths of DC power should be minimized
		(Maximum 500 m (shielded), 300 m (unshielded twisted
		pairs)).
		Twisted pairs are recommended for use.
		If the wiring is to be exposed to lightning or surges, take
		appropriate lightning protection measures and use
	Caution!	appropriate lightning arresting devices.
	Wire Routing	Keep AC, high energy, and rapidly switching DC wiring
		separate from signal cables.
		Equip ungrounded DC supplies with a resistor and
		capacitor in parallel to earth ground. This provides a path
		for static and high frequency dissipation. Typical values to
		use are 1 MOhm and 4700 pF.
		To make a connection, strip about 3/8" of insulation off
		the end of the wire (furcate terminal recommended), turn
		the connector screw counterclockwise until the gap is
	Connection	wide open, insert the wire all the way in, and turn the
		screw clockwise until it's tight.
		Connect positive DC line to the '+24V' terminal and the
		DC ground to the '0V' terminal.
2.2.2 Grounding Requi		
		nassis ground must be used. DC ground is not directly
(•)	CO	upled to earth ground internally. It is preferable not to

coupled to earth ground internally. It is preferable not to ground DC negative return to chassis ground as poor site earths can introduce noise into a system, but if necessary an earth connection should be made, from the power supply return point to the star earth point. Ground conductors should be as short and as large in size as possible. The conductors must always be large enough to carry the maximum short circuit current. Ground conductors should be connected to a star earth ground point. This ensures that no ground conductor carries current from any other branch.

2.2.3 CE Requirements

To make the MT5000 series comply with EMC directives, and to reduce susceptibility to electrical interference, a separate #14 AWG ground wire should be taken to the chassis ground terminal of the power connector. This ground connection should be run directly to the star earth connection point.

2.2.4 Safety Guidelines

This section presents recommended installation practices and procedures. Since no two applications are identical, these recommendations should be considered as guidelines.

Hardware

Considerations

Caution!

The system designer should be aware that devices in controller systems could fail and thereby create an unsafe condition. Furthermore, electrical interference in an operator interface, such as an MT5000 touch screen, can lead to equipment start-up, which could result in property damage and/or physical injury to the equipment operator.

If you, or your company, use any programmable control systems that require an operator or attendant, you should be aware that this potential safety hazard exists and take appropriate precautions. Although the specific design steps depend on your particular application, the following precautions generally apply to installation of solid-state programmable control devices. In addition, these precautions conform to the guidelines for installation of controllers as recommended in the NEMA ICS 3-304 Control Standards.

Programming

Considerations

To conform to ICS Safety Recommendations, checks should be placed in the controller to ensure that all writable registers that control critical parts of plant or machinery have limit checks built into the program, with an out-of-limit safe shutdown procedure to ensure safety of personnel.

ICS 3-304.81 Safety Recommendations:

Consideration should be given to the use of an emergency stop function, which is independent of the programmable controller.

Where the operator is exposed to the machinery, such as in loading or unloading a machine tool, or where the machine cycles automatically, consideration should be given to the use of an electromechanical override or other redundant means, independent of the programmable controller, for starting and interrupting the cycle.

If provision is required for changing programs while the equipment is in operation, consideration should be given to the use of locks or other means of assuring that only authorized personnel can make such changes.

* These recommendations are intended as safeguards against the failure of critical components and the effects of such failures or the inadvertent errors that might be introduced if programs are changed while the equipment is in operation.

• The ICS 3-304.81 Safety Recommendations are reproduced by permission of the National Electrical Manufacturers Association from NEMA ICS 3-304.

2.3 Communications Connections

The ports as you look at the back of the case, are the ports for connecting to a printer, a PLC or some other external device (Controller Connectors).

2.3.1 Connection with External Devices

Different cables are required for various devices.

Cable requirements

	Restrict cable length to less than 150m for Rs-485/422 devices and 15m					
	for RS-232 devices to avoid communications problems.					
Caution	The display will give a prompt of "PLC no response " for each					
	communications fault until the communication resumes normal. The					
Caution!	COM indicator on the front panel will light up in each communication.					
Do no insert or pull out the	Shielded cables must be used for long lengths or cables run in an					
cable while the power is	electrically noisy environment.					
on.						
	Do not run cables next to AC power lines or near sources of electrical					
	noise.					

Be sure that the cable ends have been inserted all of the way into mating connectors and are secure.

Pin Designations

Pin assignment of the 9-pin male, D-SUB, COM0. This port is used to connect the MT5000 series touch screens and provides RS-232/485/422 port controller.

Note: This port is used for MT5000 programming and debugging at the same time.

2.3.2 Connection with PC

The COM0 port on the back of the case can be used to connect PLC RS-232/485/422 devices and can also be used to connect with the programming interface and setting interface of a PC.

Connection	The port can be connected to a PC through a dedicated cable (P/N:
	MT5000-PC).

Port Function Due to the reason of communication rate, the COM0 port of a PC is only used for configuration downloading and parameter setting, and it will not be used for indirect online simulation.

2.3.3 USB Connection

The USB port on the back of the case is the USB Slave device used to connect with a PC for configuration downloading and HMI setting. It cannot be used to connect with peripheral equipment such as a USB printer.

ConnectionUSB Slave port can be connected with a PC through a general USB cable.Port FunctionThe port is only used to download user configuration program to the HMI
and to set HMI system parameters.

Port Diagram

2.3.4 Connection with Ethernet

The Ethernet port on the back of the case is a 10/100M adaptive Ethernet port. It is can be used for HMI configuration downloading, HMI system parameter setting, and indirect online simulation of configurations. In addition, multiple HMIs can be connected through the Ethernet to create an HMI application.

ConnectionThis port is connected with the HUB or Switch through a standard
Ethernet cable (RJ-45 straight-through cable) and then connected to a
LAN. It can also be directly connected with the Ethernet port of a PC
through a dual system interconnection cable (RJ-45 crossover cable).Port FunctionThis port can be used for HMI configuration downloading, HMI system
parameter setting, and indirect online simulation of configurations. In
addition, multiple HMIs can be connected through the Ethernet to
create an HMI application.

Port Diagram

2.3.5 Connection with Printer

The parallel printer port on the back of the case can be used to connect with various parallel port printers on the market.

The full series of MT5000 products support printout function. The printing port will export data when the printing component works.

The MT5000 series touch screens support multiple printers with parallel ports, and eView HMItek Ltd. will continuously provide drivers for various brands of printers.

Note: The length of the connection cable of a printer shall not exceed 5m.

		Setting Mode
OFF	OFF	Application (Online Operation) Mode

- **System Setting Mode**: In this mode, the touch screen will start a built-in system setting interface, where the user can set such parameters as IP address, brightness, contrast, and buzzer.
- **Touch Screen Calibrate Mode**: In this mode when you touch the screen, the screen will display a "+" sign, through which you can calibrate the touch accuracy of the screen.
- **Firmware Update and Basic Parameter Setting Mode**: In this mode the user can update firmware, set IP address, and perform other lower-level operations. In general, do not use this mode.
- Application (Online Operation) Mode: This is the normal working mode of MT5000 series touch screens. The screen will display the starting picture of the downloaded project.

2.4 CE Requirements The MT-5000 series of touch screens conform to the following CE specifications:

- EMC Directive (89/336/EEC, 92/31/EEC, 93/68/EEC) electromagnetic emissions and immunity;
- Machinery Directive (89/392/EEC, 91/368/EEC, 93/44/EEC, 93/ 68/EEC) machine safety;
- MT5000 series products will be CE-marked to indicate compliance with the EMC Directive.

The MT5000 series has been designed to operate satisfactorily in electromagnetic noise (immunity) and without emitting high levels of electrical noise into the environment (emission). The units are designed to meet European Community standards when installed per the wiring instructions in this manual.

CompatibilityThe MT5000 series touch screens have been designed to meetStandardselectromagnetic compatibility for industrial environments.

- CISPR (EN 55011) Group 1, Class A Radiated Emission levels
- EN61000-6-4/2001, Generic standards Emission standard for industrial environments
- EN61000-6-2/2001 Immunity for Industrial Environments
- EN61000-4/-2/-3/-4/-5/-6 Electrostatic discharge, electrostatic field immunity test, electrical fast transient/burst, surge immunity test, immunity to conducted disturbance

Installation of MT4000 Series Touch Screens

1. Installation Overview

1.1 Installation Environment

Application environment	The MT4000 series touch screens are industrial products designed for factory applications. They are designed to work stably in most industrial environments at $32 \sim 113^{\circ}$ F (0~45°C). They may not be applied to some specific outdoor environments. For specific outdoor applications, do consult your vendor!
NEMA rating (NEMA stands) for National Electrical Manufacturers Association)	The front panel of the MT4000 series touch screens conforms to the specifications of NEMA 4. When the product is correctly installed in a panel in compliance with NEMA 4 specifications, the panel still meets the protection requirements of NEMA 4, that is, no liquid will seep through the panel when the panel surface is sprayed with liquid.
Electrical	It is proved by test that the MT4000 series touch screens meet CE standard. In other words, the circuit design of the product is able to withstand the interference of electrical noise, but it cannot eliminate

environment

standard. In other words, the circuit design of the product is able to withstand the interference of electrical noise, but it cannot eliminate electrical noise under all circumstances. Correct cabling and correct grounding ensure normal operation of the product.

To ensure normal operation of the product, do not install the MT4000 series touch screens in the environment where severe mechanical vibration or shocks are present.

2. Installation Instructions

- 2.1 Installation Instructions
- 2.1.1 Location Considerations

Care should be taken when locating any equipment behind the MT4000 series of products to ensure AC power wiring, PLC output modules, contactors, starters and relays, and any other source of electrical interface are kept away from the back of these products.

Particular care should be taken to the position of variable frequency drivers and switching power supplies. Their input and output cables should be screened to a star earth point.

2.1.2 Making a NEMA-4 Mounting

Panel
DetailsThe MT4000 series of products can be mounted into panels with a depth of
over 105 mm. It is recommended that the product be installed on the front
panel of a steel enclosure. To enable the user to open the front panel of the
panel smoothly, allow a clearance of at lease 25 mm around the sides of the
installed product. To ensure smooth and easy connection of power supply and
cables, it is recommended that a panel with a depth of at least 105 mm should
be adopted.

NEMA-4 Installation Put the unit through the panel holes. Slide the clamps into the 4 holes provided around the case. Tighten the clamping screws in an even pattern until the unit is secured in the panel.

Caution! Do not over-tighten mounting clamps!

Specifications Note:

Note: To seal to NEMA-4 specifications, all supplied mounting clamps must be used and panel cannot flex more than 0.010".

2.1.3 Environmental Considerations

- The MT4000 series are to be used indoors as built-in LCD displays. Make sure that the displays are installed correctly and that operating limits are followed (See Hardware Specifications).
- Do not operate the unit in areas subject to explosion hazards due to flammable gases, vapors or dusts.
- The unit should not be installed where fast temperature variations and/or high humidity are present. This will cause condensation of water in the device and cause damage to the unit.

2.2 Power Connections

Make sure all local and national electrical standards are met when installing the unit. For details, refer to a local dealer.

2.2.1 Power Requirements

	Input voltage: 24V ±15%			
	Current: Starting current : 4300L<1A, 4300S<1A, 4300C<1.2A,			
Power Supply	4300T<1.2A			
	Working current:4300L<500mA, 4300S<500mA,			
	4300C<600mA, 4300T<600mA			
Fusing	If the display does not come on within 2 seconds of power-up, turn			
Fusing Requirement	off the power immediately. An internal fuse will prevent damage if			
	the polarity of the DC power is incorrect. Check wiring to ensure			
	proper connections and try to power up again.			

	Caution!	An Internal fuse will prevent damage for over voltage condition, however it isn't guaranteed.				
	High Voltage	DC voltage sources should provide proper isolation from main AC power.				
	Caution! Emergency Stop	A hard-wired Emergency Stop should be fitted in any system using the MT4000 touch screens to comply with ICS Safety Recommendations.				
	Caution! Supply Voltage Condition	Do not power the MT4000 touch screens and inductive loads, or input circuitry to the controller, with the same power supply. Note: The 24 VDC output from some controllers may not have enough current to power the MT4000.				
		 Wire lengths of DC power should be minimized (Maximum 500 m (shielded), 300 m (unshielded twisted pairs)). Twisted pairs are recommended for use. If wiring is to be exposed to lightning or surges, take appropriate lightning protection measures and use appropriate lightning 				
	Caution!	arresting devices.				
	Wire Routing	Keep AC, high energy, and rapidly switching DC wiring separate from signal cables.				
		Equip ungrounded DC supplies with a resistor and capacitor in parallel to earth ground. This provides a path for static and high frequency dissipation. Typical values to use are 1 MOhm and 4700 pF.				
	Connection	To make a connection, strip about 3/8" of insulation off the end of the wire (furcate terminal recommended), turn the connector screw counterclockwise until the gap is wide open, insert the wire all the way in, and turn the screw clockwise until it's tight.				
		Connect positive DC line to the '+24V' terminal and the DC ground to the '0V' terminal.				
)))Crown	ding Requirements					
		base is around must be used DC around is not directly sounded				

Chassis ground must be used. DC ground is not directly coupled to earth ground internally. It is preferable not to ground DC negative return to chassis ground as poor site earths can introduce noise into a system, but if necessary an earth connection should be made, from the power supply return point to the star earth point. Ground conductors should be as short and as large in size as possible. The conductors must always be large enough to carry the maximum short circuit current. Ground conductors should be connected to a star earth ground point. This ensures that no ground conductor carries current from any other branch.

2.2.3 CE Requirements

To make the MT4000 series comply with EMC directives, and to reduce susceptibility to electrical interference, a piece of separate #14 AWG ground wire should be taken to the chassis ground terminal of the power connector. This ground connection should be run directly to the star earth connection point.

2.2.4 Safety Guidelines

This section presents recommended installation practices and procedures. Since no two applications are identical, these recommendations should be considered as guidelines.

Hardware	Caution!
Considerations	The system designer should be aware that devices in controller
	systems could fail and thereby create an unsafe condition.
	Furthermore, electrical interference in an operator interface, such as
	an MT4000 touch screen, can lead to equipment start-up, which
	could result in property damage and/or physical injury to the
	equipment operator.
	If you, or your company, use any programmable control systems that
	require an operator or attendant, you should be aware that this
	potential safety hazard exists and take appropriate precautions.
	Although the specific design steps depend on your particular
	application, the following precautions generally apply to installation of
	solid-state programmable control devices. In addition, these
	precautions conform to the guidelines for installation of controllers as
	recommended in the NEMA ICS 3-304 Control Standards.
Programming	To conform to ICS Safety Recommendations, checks should be
Considerations	placed in the controller to ensure that all writable registers that control
Considerations	critical parts of plant or machinery have limit checks built into the
	program, with an out-of-limit safe shutdown procedure to ensure
(•)	safety of personnel.

ICS 3-304.81 Safety Recommendations:

Consideration should be given to the use of an emergency stop function, which is independent of the programmable controller.

Where the operator is exposed to the machinery, such as in loading or unloading a machine tool, or where the machine cycles automatically, consideration should be given to the use of an electromechanical override or other redundant means, independent of the programmable controller, for starting and interrupting the cycle.

If provision is required for changing programs while the equipment is in operation, consideration should be given to the use of locks or other means of assuring that only authorized personnel can make such changes.

* These recommendations are intended as safeguards against the failure of critical components and the effects of such failures or the inadvertent errors that might be introduced if programs are changed while the equipment is in operation.

• The ICS 3-304.81 Safety Recommendations are reproduced by permission of the National Electrical Manufacturers Association from NEMA ICS 3-304.

2.3 Communications Connections

The ports as you look at the back of the case, are the ports for connecting to a printer, a PLC or some other external device (Controller Connectors).

2.3.1 Connection with External Devices

Cable Different cables are required for various devices.

requirements

Restrict cable length to less than 150m for Rs-485/422 devices and 15m for RS-232 devices to avoid communications problems.

CautionThe display will give a prompt of "PLC no response..." for each
communications fault until the communication resumes normal. The COM
indicator on the front panel will light up in each communication.

Do no insert or Shielded cables must be used for long lengths or cables run in an electrically noisy environment. cable while the

power is on. Do not run cables next to AC power lines or near sources of electrical noise.

Be sure that the cable ends have been inserted all of the way into mating connectors and are secure.

 Pin
 Pin assignment of the 9-pin male, D-SUB, COM0. This port is used to connect the MT4000 series touch screens and provides RS-232/485/422 port controller.

Note: This port is used for MT4000 programming and debugging at the same time.

Pin		PLC	PLC	PLC	
#	Signal	[RS-485]	[RS-485]		PC[RS-232]
		4 wire	2 wire	[RS-232]	
1	Rx- (A)	RS-485 Rx	RS485A		
2	RxD_PLC			RS-232	
				Rx	

3	TxD_PLC			RS-232 Tx	
4	Tx-	RS-485 Tx			
5	GND	Signal ground			
6	Rx+(B)	RS-485 Rx	RS485B		
7	RxD_PC				RS-232
					Rx
8	TxD_PC				RS-232 Tx
9	Tx+	RS-485 Tx			

Pin

Designations

Pin assignment of the 9-pin female, D-SUB, COM1. This port is used to connect the MT4000 series touch screens and provides RS-232 port controller.

Pin assignment of this port is basically the same as COM0. The only difference is that COM0 is connected with the RS-232 interface of the PC to serve as the hardware flow control signal for PLC-232 connection.

COM1

Pin #	Signal	PLC [RS-485]	PLC	[RS-485]	PLC [RS-232]
		4 wire	2	2 wire	
1	Rx- (A)	RS-485 Rx	R	S485A

3	TxD_PLC				RS-232 Tx
4	Tx-	RS-485 Tx			
5	GND		Sign	al ground	
6	Rx+(B)	RS-485 Rx	(RS485B	
7	CTS_PLC				Clear to send
					input
8	RTS_PLC				Ready to send
					output
9	Tx+	RS-485 Tx			

2.3.2 Connection with PC

The COM0 port on the back of the case can be used to connect PLC RS-232/485/422 devices and can also be used to connect with the programming interface and setting interface of a PC.

Connection The port can be connected to a PC through a dedicated cable (P/N: MT4000-PC).

Port Function Due to the reason of communication rate, the COM0 port of a PC is only used for

configuration downloading and parameter setting, and it will not be used for indirect online simulation.

2.3.3 USB Connection

The USB port on the back of the case is the USB Slave device used to connect with a PC for configuration downloading and HMI setting. It cannot be used to connect with peripheral equipment such as a USB printer.

ConnectionUSB Slave port can be connected with a PC through a general USB cable.Port FunctionThe port is only used to download user configuration program to the HMI and to

set HMI system parameters.

Port Diagram

Printout

2.3.4 Connection with Printer

The parallel printer port on the back of the case can be used to connect with various parallel port printers on the market.

The full series of MT4000 products support printout function. The printing port will export data when the printing component works.

The MT4000 series touch screens support multiple printers with parallel ports, and eView HMItek Ltd. will continuously provide drivers for various brands of printers.

Note: The length of the connection cable of a printer shall not exceed 5m.

2.3.5 DIP Switch

SW1	SW2	Working Mode
ON	ON	System Setting
OFF	ON	Touch Screen Calibrate Mode
ON	OFF	Firmware Update and Basic Parameter Setting Mode
OFF	OFF	Application (Online Operation) Mode

System Setting Mode: In

this mode, the touch screen

will start a built-in system setting interface, where the user can set such parameters as IP address, brightness, contrast, and buzzer.

- **Touch Screen Calibrate Mode**: In this mode when you touch the screen, the screen will display a "+" sign, through which you can calibrate the touch accuracy of the screen.
- Firmware Update and Basic Parameter Setting Mode: In this mode the user can update firmware, set IP address, and perform other lower-level operations. In general, do not use this mode.
- Application (Online Operation) Mode: This is the normal working mode of MT4000 series touch screens. The screen will display the starting picture of the downloaded project.

2.4 CE Requirements

MT-4000 series of touch screens conform to the following CE specifications:

- EMC Directive (89/336/EEC, 92/31/EEC, 93/68/EEC) electromagnetic emissions and immunity
- Machinery Directive (89/392/EEC, 91/368/EEC, 93/44/EEC, 93/ 68/EEC) machine safety
- MT4000 series products will be CE-marked to indicate compliance with the EMC Directive

The MT4000 series has been designed to operate satisfactorily in electromagnetic noise (immunity) and without emitting high levels of electrical noise into the environment (emission). The units are designed to meet European Community standards when installed per the wiring instructions in this manual.

	The MT4000 series touch screens have been designed to meet electromagnetic compatibility for industrial environments.
	CISPR (EN 55011) Group 1, Class A Radiated Emission levels
Compatibility Standards	• EN61000-6-4/2001, Generic standards – Emission standard for industrial environments
	EN61000-6-2/2001 Immunity for Industrial Environments
	• EN61000-4/-2/-3/-4/-5/-6 Electrostatic discharge, electrostatic field immunity test, electrical fast transient/burst, surge immunity test, immunity to conducted disturbance
